# Harmful Algal Blooms (HABs)

## Definition:

- “Red/Brown/Yellow/etc Tides”
- Proliferation of microscopic organisms
- Marine, fresh & estuarine waters
-  Potential danger to:
  - Environment
  - Wildlife
  - Humans

# Harmful Algal Bloom

# Our Filthy Seas

# Causes of HABs?

**DEPENDS on Individual Organism!!!!**

- **Environmental/Biological factors**
- **?Anthropogenic Factors**
  - **?Human Interactions**
  - **?Pollution & Nutrients**
  - **?Global Change**

# Causes of HABs

- Microscopic organisms
- “Harm” =
  - Oxygen deprivation
  - Natural Toxin-production

# HAB Toxins

- **Natural Toxins**
  - Harmful in minute (picogram) doses
- **Can NOT be**
  - **detected**
    - No taste or smell
  - **eliminated**
    - Heat and acid stable
    - Cleaning, storage, cooking
- **Work at cellular level**

## Florida Red Tide and Human Health

K. Jirass, Christina Harbo, Charlotte Salinas, Paul Schmidt

### Red Tide

More in the News

When we all think back to the 1980s from the West American shores Florida red tide, it was a time of environmental concern. In the early 1980s, Florida's Gulf Coast beaches showed a dramatic increase in the number of people who were sickened by the red tide. The illness was caused by brevetoxins, a potent neurotoxin that causes respiratory distress and other symptoms. The illness was caused by brevetoxins, a potent neurotoxin that causes respiratory distress and other symptoms. The illness was caused by brevetoxins, a potent neurotoxin that causes respiratory distress and other symptoms.

**Relatives**  
Brevetoxins are the main toxins produced by the dinoflagellate *Gyrodinium aureolum*. They are also produced by other species of dinoflagellates, including *Prorocentrum* and *Prorocentrum*.

**Health**  
Brevetoxins are neurotoxins that cause respiratory distress and other symptoms. They are also produced by other species of dinoflagellates, including *Prorocentrum* and *Prorocentrum*.

**Defense**

**Feeding**  
Brevetoxins are neurotoxins that cause respiratory distress and other symptoms. They are also produced by other species of dinoflagellates, including *Prorocentrum* and *Prorocentrum*.

## RED TIDE

**HEALTH TIPS**

1. Avoid going to beach areas with red tide. If you must go, avoid swimming, wading, or surfing. If you experience respiratory distress, get out of the water and seek medical attention.
2. Avoid eating or drinking shellfish from areas with red tide. Shellfish from these areas may contain toxins that can cause illness.
3. Avoid using recreational water equipment (e.g., water slides, splash pads) in areas with red tide. The equipment may contain toxins that can cause illness.
4. Avoid using recreational water equipment (e.g., water slides, splash pads) in areas with red tide. The equipment may contain toxins that can cause illness.

**RESEARCH TIPS**

1. Contact your local health department for more information.
2. Contact your local health department for more information.
3. Contact your local health department for more information.
4. Contact your local health department for more information.

Visit our website at:  
[www.mote.org/niehsredtidestudy](http://www.mote.org/niehsredtidestudy)

The screenshot shows a Microsoft Internet Explorer browser window displaying the NIEHS Red Tide website. The browser's address bar shows the local file path: C:\NIEHS\asthma\website\11\_09\_03\TMP\ho3dspfcbd.htm. The website header features the NIEHS logo on the left and the title "NIEHS Red Tide Toxins, Health Effects and Exposure Study" in the center. Below the title are three navigation links: "Report Health Effects", "Report Fish Kills", and "Current Red Tide Status". A vertical sidebar on the left contains a list of menu items: "Research Participant", "General Public", "Science Community", "Photo Gallery", "Video Gallery", "Our Partners", "Other Resources", and "What's New". The main content area contains a cartoon illustration of several people, including a scientist with a clipboard and a child, and the heading "Welcome". Below the heading is a paragraph of introductory text: "Welcome to the Florida Red Tide and Human Health Studies Website. This Website provides information concerning Florida Red Tide and its toxins, and our research studies, as well as important links, for scientists, our Red Tide Study participants, and the general public." A second paragraph begins with the heading "What are Red Tides or HABs?" and starts with the text "Red tides or Harmful Algal Blooms (HABs) are blooms of marine and freshwater algae. These HABs or red tides appear to be increasing in incidence, time length". The browser's taskbar at the bottom shows several open applications, including Netscape, Program Files, Macromedia, Inbox - Micro..., Microsoft Excel, and multiple instances of "Untitled Doc...". The system clock in the bottom right corner displays "8:33 AM".

### Key Red Tide Facts:

- Red Tide is a microscopic alga (plant-like organism) in Florida called *Karenia brevis* or *K. brevis*.
- *K. brevis* produces a toxin that can kill fish and can cause respiratory problems in humans. People with severe respiratory problems should avoid red tide areas.
- Red Tide is a type of Harmful Algal bloom that is a world wide problem.
- Red Tide can last days, weeks or months but can change daily.
- All seafood from restaurants and hotels is monitored and is safe to eat. Avoid eating clams and oysters taken from red tide waters.
- Red tide symptoms are coughing, sneezing, and watery eyes.

Kirkpatrick, Reich, et al

# FL DOH/CDC Medical Fact Sheets & CME

Medical Fact Sheet  
Harmful Algae Bloom Series

## Neurotoxic Shellfish Poisoning (NSP)

FLORIDA DEPARTMENT OF HEALTH

OFFICE OF  
Environmental Health

**CAUSATIVE AGENT:** Neurotoxic Shellfish Poisoning (NSP) is caused by the consumption of molluscan shellfish (e.g. clams, oysters, coquinas, mussels, and other filter feeders) contaminated with natural toxins known as brevetoxins, which are produced by a marine dinoflagellate called *Karenia brevis*. *K. brevis* is principally distributed throughout the Gulf of Mexico, and occasionally along the mid- and south-Atlantic Coast. Commonly referred to as "Florida red tides," blooms of *K. brevis* most often occur during late summer and fall, but can be present any time of the year.

**SIGNS/SYMPTOMS:** Initial complaints typically include abdominal pain, nausea, vomiting, and diarrhea accompanied by progressive paresthesias, which can affect areas of the mouth and extremities. Other common symptoms include ataxia, myalgia, headache, and vertigo. Paradoxical temperature sensation (reversal of hot and cold sensations), as seen in Ciguatera Fish Poisoning, has also been reported in NSP. In more severe cases of NSP, acute respiratory depression and labile blood pressure may also be observed.

**ONSET/DURATION:** Onset of symptoms occurs within minutes to hours, definitely within 24 hours, of consuming brevetoxin-contaminated shellfish. Duration of the illness is generally short, lasting from a few hours to several days.

**DIAGNOSIS:** Diagnosis is generally based on a clinical evaluation of symptoms and recent food history. Mouse bioassay is the only technique accepted by FDA for testing samples for brevetoxin shellfish; however the use of a brevetoxin ELISA test (to evaluate biological fluids such as urine) is experimental at this time.

**TREATMENT:** No specific antitoxin is available although a new natural antagonist known as brevetol may be useful in the future. Although not well researched, the illness appears to be self-limiting, and therapy is supportive and symptom-driven.

**RISK GROUPS:** All persons are susceptible to NSP. However, young children, the elderly and those individuals with underlying neurologic disease may be at increased risk.

**PREVENTATIVE MEASURES:** The contaminated shellfish are described as tasting delicious; and the toxins cannot be removed from the shellfish by different preparation or storage methods. The Florida Department of Agriculture and Consumer Services closes shellfish harvesting areas when *K. brevis* cell counts exceed 5,000 cells per liter. In recent years most NSP cases have been the result of illegal harvesting of shellfish from closed areas. See [www.floridaaquaculture.com/sea/sea\\_statusmap.htm](http://www.floridaaquaculture.com/sea/sea_statusmap.htm) for shellfish harvesting area status.

**REPORTING REQUIREMENTS:** NSP cases must be immediately reported to the local county health department pursuant to Section 381.0031 (1), Florida Statutes.

RESEARCH • SURVEILLANCE • EDUCATION

## Neurotoxic Shellfish Poisoning

Reporting code = 98800

Case Report Form:

1. CDC 52.13 (9/89) *Investigation of Foodborne Illness*

### Clinical case definition

Onset is within a few minutes to a few hours after consumption of epidemiologically implicated shellfish. Symptoms include tingling and numbness of lips, mouth, fingers, and toes; muscular aches; dizziness, reversal of hot and cold sensations; pupil dilation; and usually accompanied by diarrhea, vomiting and ataxia. Illness is self-limited and milder than paralytic shellfish poisoning; paralysis has not been documented. Duration is from a few minutes to a few hours or a few days at most.

### Laboratory criteria for diagnosis

- Detection of toxin in epidemiologically implicated shellfish

### Case classification

**Confirmed:** Clinically compatible illness that is associated with consumption of shellfish from areas where other toxic shellfish have been found.

## Florida Red Tide Improving Predictions

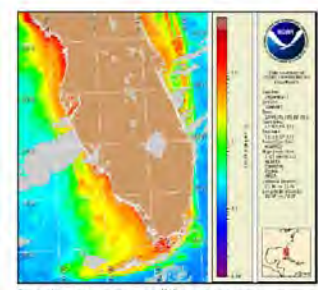

**Gulf of Mexico Harmful Algal Bloom Bulletin**  
5 January 2006  
NOAA Ocean Service  
NOAA Satellite and Information Service  
Last Update: January 3, 2006

**Conditions Report**  
A harmful algal bloom has been identified in Monroe County. Patchy low impacts are possible for the gulfside Lower Keys today and Sunday, with low to moderate impacts possible Friday and Saturday. No impacts are expected elsewhere in SW Florida through Sunday. Dead fish have been reported between Key West and Marathon in the past few days. Dead fish smell, while unpleasant, does not produce the same respiratory irritation as red tide.

**Analysis**  
The bloom near the Lower Keys remains present. Chlorophyll levels are continually elevated north and south of the Lower Keys, with levels highest north and southeast of Big Mullet Key (24°35' N, 81°34' W and 24°34' N, 81°53' W), inside the Marquesas Keys, and northeast of the Horse Shoe Keys (24°48' N, 81°16' W). Elevated chlorophyll extends along the ocean side of the Lower Keys, out to approximately 7 miles from shore. No recent samples are available for this area. A fish kill was reported on 1/3 at Egret Lane west of Marathon. Sampling is highly recommended throughout this area. Continued transport around the Lower Keys is possible throughout the weekend. Also, a slight possibility exists for the transport of additional *K. brevis* through the Lower Keys' larger passages on Friday and Saturday with the appearance of strong north to northwesterly winds.

Sampling results indicate the bloom is no longer present at the SW Florida coast, although background levels remain patchy in bay and second areas of Sarasota and Pinellas County (FWRL 1/3). Elevated chlorophyll features remain offshore Collier and Monroe Counties near 23°36' N, 82°13' W, and offshore Lee and Collier Counties at 26°16' N, 82°27' W. Sampling, if possible, is recommended. Overall movement has been minimal; the features will likely remain offshore and continue southward migration. Fisher, Broderick

Please see the following restrictions on all SeaWiFS images received from CoastWatch:  
1. This is an unclassified satellite image application only. It is not for military and local government use/distribution is permitted.  
2. Image products may be published in newspapers. Any other publishing arrangements must receive Orbimage approval via the CoastWatch Program.

SW Florida: Westerly winds (5-10kts, 1-5m/s) today will shift northwesterly, strengthening to 25kts (10m/s) after midnight through Friday. Continued northwesterlies on Saturday will weaken to 15kts (5m/s) and turn northwesterly on Saturday night at 10kts (5kts). Mild easterlies expected Sunday and Monday (5-10kts, 3-5m/s).

FL Keys: Northwest to north winds (10kts, 5m/s) today, becoming westerly this afternoon into tonight at 15kts (8m/s). Strong northwesterlies on Friday up to 25kts (13m/s) and gusty will shift northerly Friday night into Saturday, weakening to 15kts (8m/s). North to northeast to east near 15kts (8m/s) on Sunday. Southeast to east winds expected Monday.

# NOAA HAB Bulletins

Gulf of Mexico Harmful Algal Bloom Bulletin

## Conditions Report

A harmful algal bloom has been identified in Monroe County. Patchy low impacts are possible for the gulfside Lower Keys today and Sunday, with low to moderate impacts possible Friday and Saturday. No impacts are expected elsewhere in SW Florida through Sunday. Dead fish have been reported between Key West and Marathon in the past few days. Dead fish smell, while unpleasant, does not produce the same respiratory irritation as red tide.

## Analysis

The bloom near the Lower Keys remains present. Chlorophyll levels are continually elevated north and south of the Lower Keys, with levels highest north and southeast of Big Mullett Key (24°35'N, 81°54'W and 24°34'N, 81°53'W), inside the Marquesas Keys, and northeast of the Horseshoe Keys (24°48'N, 81°16'W). Elevated chlorophyll extends along the ocean side of the Lower Keys, out to approximately 7 miles from shore. No recent samples are available for this area. A fish kill was reported on 1/3 at Egret Lane west of Marathon. Sampling is highly recommended throughout this area. Continued transport around the Lower Keys is possible throughout the weekend. Also, a slight possibility exists for the transport of additional *K. brevis* through the Lower Keys' larger passages on Friday and Saturday with the appearance of strong north to northwesterly winds.

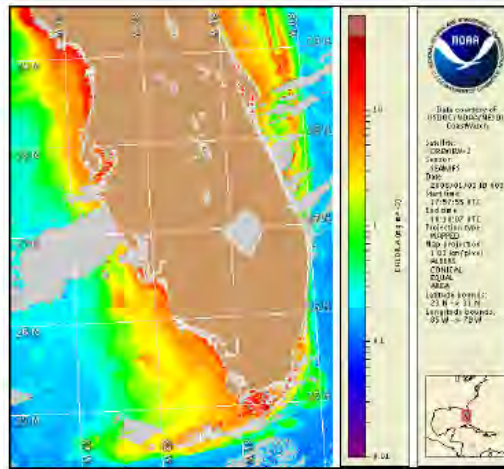

Sampling results indicate the bloom is no longer present at the SW Florida coast, although background levels remain patchy in bay and sound areas of Sarasota and Pinellas County (FWRI, 1/3). Elevated chlorophyll features remain offshore Collier and Monroe Counties near 25°36'N, 82°13'W, and offshore Lee and Collier Counties at 26°16'N, 82°27'W. Sampling, if possible, is recommended. Overall movement has been minimal; the features will likely remain offshore and continue southward migration.   
 - Fisher, Bronder

Please note the following restrictions on all SeaWiFS imagery derived from CoastWatch:

1. Data are restricted to civil marine applications only; i.e. federal, state, and local government use/distribution is permitted.
2. Image products may be published in newspapers. Any other publishing arrangements must receive OrbImage approval via the CoastWatch Program.

Forecast

Detailed Analysis

Satellite chlorophyll image with possible HAB areas shown by red polygon(s).

Infrared Satellite Imagery (Chlorophyll a)

Wind conditions from Vaca Key, FL. Wind speed and direction are averaged over 12 hours from buoy measurements. Length of line indicates speed; angle indicates direction. Red indicates that the wind direction favors upwelling near the coast. Values to the left of the dotted vertical line are measured values; values to the right are forecasts.

SW Florida: Westerly winds (5-10kts, 8m/s) today will shift northwesterly, strengthening to 20kts (10m/s) after midnight through Sunday. Continued northwesterlies on Saturday will weaken to 15kts (8m/s) and turn northerly Saturday night at 10kts (5m/s). Mild easterlies expected Sunday and Monday (5-10kts, 8m/s).

FL Keys: Northwest to north winds (10kts, 5m/s) today will shift northwesterly this afternoon into tonight at 15kts (8m/s). Strong northwesterlies (15-25kts, 13m/s and gusty) will shift northerly Friday night into Saturday, with gusts to 25kts (8m/s). North to northeast winds near 15kts (8m/s) on Sunday. Northwesterlies expected Monday.
