Due to changes in testing strategies in BC, current case counts are an underestimate of the true number of COVID-19 cases in BC. This underestimation has increased compared to the period prior to the emergence of the Omicron variant in BC.

The provincial incidence by episode date was 18 per 100K (927 cases) in week 29, which has decreased from 20 per 100K in week 28.

Incidence by Health Authority from week 28 to week 29:
- Fraser Health incidence decreased from 19 to 17 per 100K
- Interior Health incidence increased from 18 to 20 per 100K
- Vancouver Island Health incidence decreased from 24 to 17 per 100K
- Northern Health incidence increased from 17 to 19 per 100K
- Vancouver Coastal Health incidence decreased from 21 to 17 per 100K

Testing of MSP-funded specimens decreased from ~6,200 in week 28 to ~5,200 in week 29, and the percent positivity of MSP-funded specimens remained stable at 19.6% in week 28 and 20.5% in week 29.

The per capita testing rates for MSP-funded specimens between week 28 and week 29 decreased in all age groups except in the 10-14 year-olds, where testing rates remained stable at 20 per 100K in week 28 and 21 per 100K in week 29. Percent positivity increased the most in 15-19 year-olds, where it increased from 8.5% in week 28 to 17.0% in week 29.

Age-specific incidence rates between week 28 and week 29 decreased or remained stable in all age groups. Incidence rates decreased the most in the 80+ year-olds from 109 per 100K in week 28 to 94 per 100K in week 29.

The number of people in hospital with a positive COVID-19 test decreased from 297 in week 28 to 238 in week 29. The number of people in critical care increased from 36 in week 28 to 41 in week 29. In week 29, 60+ year-olds had the highest number of people in hospital with a positive COVID-19 test, with 93 hospitalizations in 60-79 year-olds and 85 hospitalizations in 80+ year-olds. In week 29, 60-79 year-olds had the highest number of people in critical care (18 critical care admissions).

The weekly number of deaths from any cause among people testing positive for COVID-19 decreased from 39 in week 28 to 29 in week 29. In week 29, 60-79 and 80+ year-olds had the highest number of deaths from any cause among people testing positive for COVID-19 (14 deaths in each age group). From week 14 to week 23 where the UCD has been reported for at least 95% of the post-transition deaths, an average of 43% of these death were reported to have COVID-19 as their UCD.

In week 29, based on earliest symptom onset date (if unavailable, then outbreak declared date is used), 4 new care facility outbreaks were declared.

Changes in SARS-CoV-2 viral loads in Metro Vancouver wastewater plants are variable. Viral loads in both plants in FH have increased, following two to three weeks of decrease. Further data will be required to determine whether this a sustained trend in FH.
BELOW ARE IMPORTANT NOTES relevant to the interpretation of cases, hospitalizations, and deaths:

- Due to changes in testing strategies in BC in 2022 focusing on targeted higher risk populations, current case counts are an underestimate of the true number of COVID-19 cases in BC. This underestimation has increased compared to the period prior to the emergence of the Omicron variant in BC.
- Hospital data include admissions for people who test positive for COVID-19 through hospital screening practices, regardless of the reason for admission. Therefore, reported hospitalizations overestimate the true number of people who are hospitalized specifically due to COVID-19 infection.
- Pre-transition (case line list) deaths include COVID-19 related deaths reported by Health Authorities up to April 1, 2022. As of April 2, 2022, post-transition (automated linkage) deaths include people who died from any cause recorded in Vital Statistics within 30 days of their first positive COVID-19 lab result date. Deaths reported after the system transition use a broader definition and will overestimate the true number of deaths due to COVID-19 since death registration is recorded before the underlying cause of death is determined. Due to the change in data source for death data, the number of pre-transition deaths should not be compared to the number of post-transition deaths.

BELOW ARE IMPORTANT NOTES relevant to the interpretation of data displayed in this bulletin:

- Cases include lab confirmed, lab probable, and epi-linked cases. Case definition can be found at [http://www.bccdc.ca/health-professionals/clinical-resources/case-definitions/covid-19-(novel-coronavirus)](http://www.bccdc.ca/health-professionals/clinical-resources/case-definitions/covid-19-(novel-coronavirus)). Cases include those reported in Health Authority case line lists and positive laboratory results in the Provincial Laboratory Information Solution (PLIS) up to April 1, 2022. As of April 2, 2022, only positive laboratory results in the PLIS are included and cases who are residents from outside of BC are not included.
- Episode date is defined by date of illness onset when available. When illness onset date is unavailable, earliest laboratory date is used (collection or result date); if also unavailable, then public health case report date is used. As of April 2, 2022, episode date reflects earliest laboratory date (collection or result date) only. Analyses based on episode date may better represent the timing of epidemic evolution. Episode-based tallies for recent weeks are expected to increase as case data are more complete.
- Surveillance date is defined by lab result date, if unavailable, then public health case report date is used. As of April 2, 2022, surveillance date reflects lab result date only. The weekly tally by surveillance date includes cases with illness onset date in preceding weeks.
- Hospitalizations include those reported by Health Authorities up to April 1, 2022. As of April 2, 2022, hospitalizations are defined as individuals who test positive for COVID-19 and are hospitalized as recorded in the PHSA Provincial COVID-19 Monitoring Solution (PCMS). Hospitalizations for individuals 0-19 years-old are reported by linked hospitalization episodes from the PCMS since the beginning of the pandemic. Episode date for hospitalization is defined by admission date, if unavailable, surveillance date is used.
- Critical care admissions (HAU, ICU, and critical care surge beds) include individuals who test positive for COVID-19 and are in critical care admission as recorded in the PCMS. Episode date for critical care admission is defined by critical care admission date, if unavailable, surveillance date is used. Previously only ICU admissions were presented in this report. Critical care admissions comprises a broader category than ICU admissions and therefore, the number of critical care admissions should not be compared to number of ICU admissions from previous weeks.
- Deaths include COVID-19 related deaths reported by Health Authorities up to April 1, 2022. As of April 2, 2022, deaths are any COVID-19 lab positive cases who died from any cause recorded in Vital Statistics within 30 days of their first positive lab result date. Episode date for death is defined by death date, if unavailable, surveillance date is used.
- As of April 2, 2022, data on Health Authority outbreaks are compiled from outbreak files provided by the Health Authorities.
- Laboratory PLOVER data include Medical Service Plan (MSP) funded (e.g. clinical diagnostic tests) and non-MSP funded (e.g. screening tests) specimens.
- Per capita rates/incidences for year 2020 are based on Population Estimates 2020 (n= 5,147,772 for BC overall), for year 2021 are based on PEOPLE 2021 estimates (n= 5,194,137 for BC overall), and for year 2022 is based on PEOPLE 2021 estimates (n= 5,263,772 for BC overall).
- Data sources include Health Authority case line lists, PHSA Provincial COVID-19 Monitoring Solution (PCMS), Vital Statistics, laboratory PLOVER data, and aggregate outbreak files from Health Authorities.
- Integrated case data (including surveillance variables created using Health Authority case line lists, PCMS, and Vital Statistics) were extracted on August 01, 2022, laboratory PLOVER data on August 02, 2022, and Health Authority outbreak files on July 27, 2022.
A. COVID-19 case counts and epidemic curve

Due to changes in testing strategies in BC in 2022 focusing on targeted higher risk populations, current case counts are an underestimate of the true number of COVID-19 cases in BC. This underestimation has increased compared to the period prior to the emergence of the Omicron variant in BC. Up to week 29, there have been 378,365 cases for a cumulative incidence of 7,188 per 100K (Table 1, Figure 1). The provincial incidence by episode date was 18 per 100K (927 cases) in week 29, which has decreased from 20 per 100K in week 28.

Incidence rates from week 28 to week 29 decreased in all HAs except Northern Health (NH) and Interior Health (IH), where the incidence rate increased from 17 per 100K in week 28 to 19 per 100K in week 29 and from 18 per 100K in week 28 to 20 per 100K in week 29, respectively. Incidence rates increased the most in NH from 17 per 100K in week 28 to 19 per 100K in week 29. In week 29, the highest incidence rate was in IH at 20 per 100K. Incidence by episode date may increase as data become more complete in recent week.

Figure 1. Episode-based epidemic curve (bars), surveillance date (line) and Health Authority (HA), BC Jan 3, 2021 (week 1) – Jul 23, 2022 (week 29) (N=322,515)
B. Test rates and percent positive

**COVID-19 testing guidelines** recommend testing for people who have COVID-19 symptoms, and are at risk of more severe disease or live/work in high-risk settings. As shown by the darker-colored bars and dotted line in Figure 2, the number of MSP-funded specimens decreased from ~6,200 in week 28 to ~5,200 in week 29, and the percent positivity of MSP-funded specimens remained stable at 19.6% in week 28 and 20.5% in week 29.

As shown by the dotted lines in Figure 3, the per capita testing rates for MSP-funded specimens (Panel A) decreased in all HAs. In week 29, Vancouver Coastal Health (VCH) had the highest testing rate at 100 per 100K. The percent positivity (Panel B) for MSP-funded specimens decreased or remained stable in all HAs except for FH and IH, where the percent positivity increased from 17.1% in week 28 to 21.7% in week 29 and from 20.4% in week 28 to 22.9% in week 29, respectively. In week 29, percent positivity ranged from 20.7% in VCH to 22.9% in IH.

**Figure 2.** Number of specimens tested and percent SARS-CoV-2 positive, by collection week, BC Jan 3, 2021 (week 1) – Jul 23, 2022 (week 29)

**Figure 3.** Testing rates and percent SARS-CoV-2 positive by Health Authority and collection week, BC Jan 3, 2021 (week 1) – Jul 23, 2022 (week 29)

Data source: Laboratory PLOVER data
C. Age profile, testing and cases

Testing rates and percent positivity by age group
As shown by the bars in Figure 4, the per capita testing rates for MSP-funded specimens between week 28 and week 29 decreased or remained stable in all age groups. As shown by the black dots in Figure 4, percent positivity between week 28 and week 29 increased or remained stable in all age groups. Percent positivity increased the most in 15-19 year-olds, where it increased from 8.5% in week 28 to 17.0% in week 29, though there was a drop in testing rate for this age group. In week 29, percent positivity ranged from 11.0% in 5-9 year-olds to 23.4% in 80+ year-olds.

Case distribution and weekly incidence by age group
As shown in Figure 5, age-specific incidence rates between week 28 and week 29 decreased or remained stable in all age groups. Incidence rates decreased the most in the 80+ year-olds from 109 per 100K in week 28 to 94 per 100K in week 29.

Figure 4. Average weekly SARS-CoV-2 MSP testing rates and MSP percent positive by known age group, BC Jun 18, 2022 (week 24) – Jul 23, 2022 (week 29)

Figure 5. Weekly age-specific COVID-19 incidence per 100K population by epidemiological week, BC Jan 3, 2021 (week 1) – Jul 23, 2022 (week 29) (N= 322,423)
D. Severe outcomes

Hospital data include admissions for people who test positive for COVID-19 through hospital screening practices, regardless of the reason for admission. Therefore, reported hospitalizations overestimate the true number of people who are hospitalized specifically due to COVID-19 infection. The number of people in hospital with a positive COVID-19 test decreased from 297 in week 28 to 238 in week 29. The number of people in critical care increased from 36 in week 28 to 41 in week 29.

As of April 2, 2022, death data include people who test positive for COVID-19 and died from any cause (COVID-19 or non-COVID-19) within 30 days of their first positive lab result date. The weekly number of deaths from any cause among people testing positive for COVID-19 decreased from 39 in week 28 to 29 in week 29 (Table 2).

Cumulatively, there have been 32 confirmed cases of Multi-system Inflammatory Syndrome in children and adolescents (MIS-C) in BC since January 1, 2020. There have been no new confirmed cases of MIS-C since the last report. The median age of all cases is 9 years old (range from 4 months old to 16 years old).

</tr>
</tbody>
</table>

a. Cases with unknown outcome are included in the denominators (i.e. assumed not to have the specified severe outcome).

b. Due to the change in data source for hospitalization data, ICU admissions are no longer available. Critical care admissions are now being provided, which comprises a broader category than ICU admissions (please see Important Notes on Page 2 for more information). Number of critical care admissions should not be compared to number of ICU admissions from previous weeks.

c. Pre-transition (case line list) deaths include COVID-19 related deaths reported by Health Authorities up to April 1, 2022. As of April 2, 2022, post-transition (automated linkage) deaths are any COVID-19 lab positive cases who died from any cause recorded in Vital Statistics within 30 days of their first positive lab result date. Deaths reported after the system transition use a broader definition and will overestimate the true number of deaths due to COVID-19 since death registration is recorded before the underlying cause of death is determined. Due to the change in data source for death data, the number of pre-transition deaths should not be compared to the number of post-transition deaths.
### E. Age profile, severe outcomes

Table 3 displays the distribution of cases and severe outcomes. In week 29, median age of hospital admissions, critical care admissions, pre-transition deaths, and post-transition deaths with underlying cause of death (UCD) as COVID-19 was 67 years, 63 years, 82 years, and 86 years, respectively.

In week 29, 60+ year-olds had the highest number of people in hospital with a positive COVID-19 test, with 93 hospitalizations in 60-79 year-olds and 85 hospitalizations in 80+ year-olds. In week 29, 60-79 year-olds had the highest number of people in critical care (18 critical care admissions). In week 29, 60-79 and 80+ year-olds had the highest number of deaths from any cause among people testing positive for COVID-19, with 14 deaths in each age group (Figure 6).

In the past four weeks (from week 26 to week 29), there has been a weekly average of 2 deaths in those <60 years of age, 5 deaths in 60-69 year-olds, 9 deaths in 70-79 year-olds and 19 deaths in the 80+ year-olds (data not shown). The number of deaths may increase over time as data becomes more complete.

</tbody>
</table>

a. Among those with available age information only.

b. Due to the change in data source for hospitalization data, ICU admissions are no longer available. Critical care admissions are now being provided, which comprises a broader category than ICU admissions (please see Important Notes on Page 2 for more information). Number of critical care admissions should not be compared to number of ICU admissions from previous weeks.

c. Pre-transition (case line list) deaths include COVID-19 related deaths reported by Health Authorities up to April 1, 2022. As of April 2, 2022, post-transition (automated linkage) deaths are any COVID-19 lab positive cases who died from any cause recorded in Vital Statistics within 30 days of their first positive lab result date. Deaths reported after the system transition use a broader definition and will overestimate the true number of deaths due to COVID-19 since death registration is recorded before the underlying cause of death is determined. Due to the change in data source for death data, the number of pre-transition deaths should not be compared to the number of post-transition deaths.

d. Since underlying cause of death (UCD) takes approximately 8 weeks to be recorded, all-cause mortality is initially reported and then retrospective evaluations of underlying cause of death are provided here to better understand true COVID-19 mortality. UCD as COVID-19 are deaths that have been determined to be caused by COVID-19 in their Vital Stats record. UCD as non-COVID-19 are deaths that have been determined to be not attributable to COVID-19 in their Vital Stats record that are reported as deaths due to a lab positive COVID-19 test within 30 days of death. UCD pending are all post-transition deaths that do not yet have a recorded UCD.
**Figure 6. Weekly COVID-19 hospital admissions (A), critical care admissions (B), and deaths (C) by age groups, BC, Jan 3, 2021 (week 1) – Jul 23, 2022 (week 29)**

- A. Hospitalization
  - Expected to show greatest increase by epidemiological week as data become more complete.

- B. Critical Care
  - Expected to show greatest increase by epidemiological week as data become more complete.

- C. Death
  - Expected to show greatest increase by epidemiological week as data become more complete.

**Figure 6.** Among those with available age information only.

**Figure 7** displays the number of pre-transition deaths and post-transition deaths (i.e. people who test positive for COVID-19 and died from any cause within 30 days of their first positive lab result date) by underlying cause of death as recorded in Vital Statistics from week 10 to week 29 in 2022. From week 14 to week 23 where the UCD has been reported for at least 95% of the post-transition deaths, an average of 43% of these death were reported to have COVID-19 as their UCD. Post-transition deaths with complete UCD are expected to increase over time.

**Figure 7.** Pre- and post-transition deaths by underlying cause of death, BC, Mar 06, 2022 (week 10) – Jul 23, 2022 (week 29)

- a. Pre-transition (case line list) deaths include COVID-19 related deaths reported by Health Authorities up to April 1, 2022. As of April 2, 2022, post-transition (automated linkage) deaths are any COVID-19 lab positive cases who died from any cause recorded in Vital Statistics within 30 days of their first positive lab result date. Deaths reported after the system transition use a broader definition and will overestimate the true number of deaths due to COVID-19 since death registration is recorded before the underlying cause of death is determined. Due to the change in data source for death data, the number of pre-transition deaths should not be compared to the number of post-transition deaths.

- b. Since underlying cause of death (UCD) takes approximately 8 weeks to be recorded, all-cause mortality is initially reported and then retrospective evaluations of underlying cause of death are provided here to better understand true COVID-19 mortality. UCD as COVID-19 are deaths that have been determined to be caused by COVID-19 in their Vital Stats record. UCD as non-COVID-19 are deaths that have been determined to be not attributable to COVID-19 in their Vital Stats record that are reported as deaths due to a lab positive COVID-19 test within 30 days of death. UCD pending are all post-transition deaths that do not yet have a recorded UCD.
F. Care facility outbreaks

As shown in Table 4 and Figure 8, 691 care facility (acute care and long-term care settings) outbreaks were reported in total in BC to the end of week 29. In week 29, based on earliest symptom onset date (if unavailable, then outbreak declared date is used), 4 new care facility outbreaks were declared (3 in long-term care and 1 in acute care). In the past four weeks (from week 26 to week 29), there has been a weekly average of 4 care facility outbreaks.

Table 4. COVID-19 care facility outbreaks by earliest case onset\textsuperscript{a}\textsuperscript{b}\textsuperscript{c}, associated cases and deaths by episode date, BC Jan 15, 2020 (week 3) – Jul 23, 2022 (week 29) (N=691)\textsuperscript{d}\textsuperscript{e}

Figure 8. COVID-19 care facility outbreaks by earliest case onset\textsuperscript{a}\textsuperscript{b}\textsuperscript{c}, facility type (A) and Health Authority (B), BC Jan 3, 2021 (week 1) – Jul 23, 2022 (week 29) (N=440)\textsuperscript{d}\textsuperscript{e}

\textsuperscript{a} Case and death counts include PCR positive cases only for outbreaks in NHA and VIHA. Vancouver Coastal Health, Fraser Health Authority, and Interior Health Authority outbreaks may also include those diagnosed by rapid antigen tests or considered as suspect reinfection.

\textsuperscript{b} Earliest dates of onset of outbreak cases are subject to change as investigations and data are updated. If unavailable, outbreak declared date is used.

\textsuperscript{c} New outbreaks reported since the last report with an earliest case onset date (if unavailable, outbreak declared date is used) prior to the current reporting week will be included in the cumulative care facility outbreak total.

\textsuperscript{d} Cases with unknown role are included in the case count for Staff/other.

\textsuperscript{e} Data might be incomplete or vary from what was reported previously due to updates by Health Authorities.
G. Wastewater surveillance

The BCCDC and Metro Vancouver measure SARS-CoV-2 in wastewater at five wastewater treatment plants (treating wastewater from 50% of BC’s population). To account for changing wastewater volume due to rainfall or snowmelt, SARS-CoV-2 concentrations are normalized to wastewater flow. Normalized SARS-CoV-2 wastewater levels (measured as viral copies per day) are shown alongside incident COVID-19 cases in each wastewater catchment area in Figure 9 and Figure 10. The BCCDC’s test results are obtained from the liquid fraction of the wastewater sample. Other organizations, such as the National Microbiology Laboratory, test from the solid fraction of wastewater and therefore, their results are not directly comparable.

Key messages with results through to July 30, 2022:

- Changes in SARS-CoV-2 viral loads in Metro Vancouver wastewater plants are variable, with some increasing and some decreasing. There is no evidence of a consistent pattern of changes in COVID-19 incidence across the region. Viral loads in both plants in FH have increased, following two to three weeks of decrease. Further data will be required to determine whether this a sustained trend in FH.
- Over the past week, viral loads at Annacis Island (Fraser North and South) have increased by 22%.
- Over the past week, viral loads at Northwest Langley (Northwest Langley) have increased by 83%.
- Over the past week, viral loads at Iona Island (Vancouver) have increased by 23%.
- Over the past three weeks, viral loads at Lulu Island (Richmond) have decreased by 41%.
- Over the past week, viral loads at Lions Gate (North Shore) have decreased by 46%.
