Introduction
This summary is prepared at the BCCDC in collaboration with regional health authorities in BC. Epidemiological data are summarized to provide an understanding of the public health risk of mpox. Data in this summary are based on confirmed cases reported to BCCDC by Health Authorities as of the date and time indicated above. The information in this report may be incomplete for the more recent cases. The current case definitions are available on the BCCDC website.

Overview
- The total number of confirmed mpox cases is 190. The weekly incidence is declining.
- Over 4,000 monkeypox virus tests have been performed in BC.
- For the vast majority of cases, the most likely mode of transmission was person-to-person transmission through close, intimate contact during sexual activity.
- Over 26,000 doses of Imvamune® vaccine have been administered in BC.

Epidemiological Curve

Figure 1. Confirmed mpox cases by week of episode date\(^1\) and health authority, BC, May 15 to Dec 10, 2022 (n=190\(^2\))

---

\(^1\) Episode date is the date of the earliest symptom if known, else lab specimen collection date.

\(^2\) Cases pending episode date are excluded.
**Exposure Information**

During the public health investigation of mpox cases, potential exposures are assessed to better understand sources of infection.

- Based on the exposure information collected, for the vast majority of cases the most likely mode of transmission was person-to-person transmission through close, intimate contact during sex.
- A quarter of all cases had a known contact either with a mpox case, a person with symptoms compatible with mpox symptoms, or with materials contaminated with monkeypox virus.
- Most cases didn’t travel out of BC during the 21 days preceding their illness onset, suggesting acquisition in BC.
