SPSN Report #1, 2023-24 season  
Epi Weeks 35 to 41: August 27 to October 14, 2023

Below is a summary of valid specimens and respiratory pathogens detected by the Sentinel Practitioner Surveillance Network (SPSN) during the period spanning epi-weeks 35 to 41 (August 27 to October 14) 2023.

Figure 1. Specimens submitted to the SPSN overall and by province, epi-weeks 35-41, 2023 (N=358)

For the distribution of SPSN specimens by province and age group, see Table 1.

**SPSN specimens with at least one respiratory pathogen detected (n, %):** 218/358 (61%)

**Respiratory virus detections among SPSN specimens, epi-weeks 35-41, 2023 (n, %):**
1. Enterovirus/rhinoviruses (EV/RV): 121 (34%)
2. SARS-CoV-2: 42 (12%)
3. Respiratory syncytial virus (RSV): 15 (4%)
4. Parainfluenza: 15 (4%)
5. Influenza viruses: 8 (2%)
6. Other (seasonal coronaviruses, human metapneumovirus (HMPV), and adenoviruses): 16 (5%)

SPSN findings by epi-week are shown in Figure 2, and for each province in Figure 3.

EV/RV and SARS-CoV-2 are also predominating among general laboratory specimens in British Columbia, but with slightly more influenza than RSV detected. These detections are mostly driven by hospital specimens whereas the SPSN reflects outpatient testing. For more respiratory pathogen surveillance globally, see Table 2.

The 2023-24 vaccine effectiveness (VE) analysis period begins from epi-week 44. The World Health Organization recommended that only the A(H1N1) component of the northern hemisphere’s 2023-24 influenza vaccine be updated from the prior season. See 2022-23 vaccine strains and updates for 2023-24 below.
