Highlights
In week 37 (Sept 13-19), BC continued to experience an increase in influenza activity. The proportion of patients presenting to sentinel physicians with ILI and the proportion of Medical Services Plan claims for influenza illness increased compared to the previous week. Emergency room visits to BC Children’s Hospital due to ILI remained approximately constant, at levels above those observed last year. One school outbreak and one long term care facility pH1N1 outbreak were reported during this period. At the BC Provincial Laboratory, 19.3% (49/374) of respiratory specimens were positive for influenza A, and all subtyped isolates were the pandemic H1N1 virus (pH1N1). Together surveillance indicators suggest that influenza activity is increasing and remains above the expected range for this time of year.

Report written: September 23, 2009
Edited: September 23, 2009
Disseminated/posted to web: Sept 23, 2009

British Columbia

Sentinel Physicians
During week 37, the percentage of patients presenting to sentinel physicians with ILI increased to 0.74%. This is substantially above the expected range for this time year. 74% (29/39) of sentinel physicians reported for week 37.

BC Children’s Hospital Emergency Room
During week 37, 5.9% of Emergency Room visits to BC Children’s hospital were attributed to ILI. This is similar to the previous week and above the proportion observed during the same time last year.
Medical Services Plan

Influenza illness as a proportion of all submitted BC Medical Services Plan (MSP) claims increased in week 37. On a regional level, increases occurred in VIHA, VCH, and FHA. In these regions the proportion of claims for influenza is at or exceeding the 10 year maximum.

*Influenza illness is tracked as the percentage of all submitted MSP general practitioner claims with ICD-9 code 487 (influenza).

**MSP week 27 Sep 2009 corresponds to sentinel ILI week 40.

***Current to September 15, 2009
Laboratory Reports

There has been a large increase in the number of respiratory specimens submitted to BCCDC Laboratory Services. In week 37 they tested 590 respiratory specimens. 114 (19.3%) tested positive for influenza A (including pH1N1). Of those subtyped (n=102), 100% were pH1N1. No influenza B was detected. These proportions are similar to the previous week. Respiratory pathogens detected included: rhino/enterovirus (3% of specimens tested) and adenovirus (0.2%).

During week 37, Children’s and Women’s Health Centre Laboratory tested 72 respiratory specimens. Five were positive for influenza, 1 tested positive for parainfluenza and 1 for adenovirus.

Note: The increase in bars during weeks 17-19 above reflects the large surge in specimens submitted to BCCDC for testing (2594 specimens were tested, a 5-fold increase over the number of tests performed during the 3-week period of peak activity this season).
ILI Outbreaks
During week 37, one school outbreak was reported in VIHA, and a pH1N1 outbreak in a long term care facility was reported in VCH.

Number of Influenza-Like Illness (ILI) Outbreaks Investigated or Reported, Compared to Current ILI Rate and Average ILI Rate for past 19 years, per Week
British Columbia, 2008-2009

* Influ LTCF = Long-term care facility, influenza identified
* Other LTCF = Long-term care facility, other pathogen identified (including RSV, parainfluenza, adenovirus, and rhino/enterovirus)
* ILI (No Pathogen) LTCF = Long-term care facility, no pathogen identified

Pandemic H1N1 (pH1N1)
BCCDC continues to monitor the pH1N1 virus pandemic. As of September 21, fifty-one cases in BC have been admitted to hospital. Among hospitalized cases, 63% had underlying medical conditions; 21% had lung disease, 15% had asthma and 10% had chronic heart disease. 39% (20) of hospitalized cases have been admitted to the intensive care unit and 12% (6) have died. As shown in the graph below, pH1N1 hospitalization rates are highest in those under 2 years of age.

For further description of BC pH1N1 cases, visit: www.bccdc.ca/dis-cond/DiseaseStatsReports/influSurveillanceReports.htm

Pandemic H1N1*, BC Cases by Collection Date (as of September 21, 2009)
N = 964 (including 51 hospitalized cases)
* formerly known as swine-origin influenza virus
FluWatch

During week 36, national influenza activity levels increased slightly. Compared to week 35, ILI consultation rates increased from 14 to 23 consultations per 1000 patient visits; however this is within the expected range for this time of year. Compared to the previous week, the proportion of tests positive for influenza remained approximately constant at 2.5%, this represents an overall decline from 23% tests positive per patient visits in the week ending June 13. www.phac-aspc.gc.ca/fluwatch/

National Microbiology Laboratory

Since Sept 1, 2008 and as of August 31, 1306 influenza isolates from provincial and hospital labs have been characterized at the National Microbiology Laboratory (NML):

- 262 A/Brisbane/59/07(H1N1)-like* † from BC, AB, SK, MB, ON, QC, NB, NS, & PEI;
- 172 A/Brisbane/10/07(H3N2)-like* † from ten provinces;
- 11 B/Florida/04/06(Yamagata)-like* from AB, ON, QC & NB;
- 379 B/Malaysia/2506/04(Victoria)-like from all ten provinces;
- 180 B/ Brisbane/60/08(Victoria)-like † from BC, AB, SK, MB, ON, QC, NB, NS, & NU; and
- 302 A/California/07/2009-like§ from BC, AB, SK, MB, ON, QC, NB, NS, NT, & NU;

* indicates a strain match to the 2008-09 vaccine
† indicates a strain match to the 2009-10 vaccine
§ A/California/07/2009 (H1N1) is the variant reference virus (pH1N1) selected by WHO for a pandemic influenza A/H1N1 vaccine.

Antiviral Resistance

Drug susceptibility testing at the NML as of August 31 indicated that most (n=320) human influenza A/H1N1 isolates tested to date were resistant to oseltamivir (one human H1N1 isolate identified since mid-April was sensitive). All human H3N2 (n=194), influenza B (n=573), and pH1N1 (n=527) isolates tested at the NML were found to be sensitive to oseltamivir. Of the isolates tested for amantadine resistance, all (n=319) human H1N1 isolates were found to be sensitive, all (n=396) human H3N2 isolates were found to be resistant, and all (n=361) pH1N1 isolates were found to be resistant. All 1305 (257 human H1N1, 190 human H3N2, 578 influenza B, and 280 pH1N1) isolates that have been tested for zanamivir resistance were sensitive.

Global surveillance has shown that circulating pH1N1 viruses are resistant to amantadine but remain sensitive to zanamivir and oseltamivir, although sporadic cases of oseltamivir resistance have been observed worldwide. The first cases of oseltamivir resistance with an epidemiological link were identified in the US on August 14 and 19.

INTERNATIONAL

Northern Hemisphere: In the United States, in the week ending September 12 influenza activity as determined by sentinel physician visits and geographic spread increased. 4.4% of visits to sentinel physicians were for ILI, an increase from 1.4% in week 33. Eighteen percent of respiratory specimens tested in reference laboratories during this week were positive for influenza, this proportion was similar to the previous week. Ninety-nine percent of the subtyped influenza A viruses were pH1N1. In Europe for the week ending September 13, influenza activity remains low or declining in most countries, with the exception of Sweden where there is medium, widespread activity with an increasing trend. http://www.cdc.gov/flu/weekly/ and http://www.eiss.org .

Southern Hemisphere: Several countries in the Southern Hemisphere previously reporting severe winter influenza activity have now passed the peak. Notably as of September 4th in Australia, influenza activity is continuing to decrease and presentations to sentinel physicians and ERs is below the previous years average. In New Zealand as of September 13th, pH1N1 activity continues to decline; consultations with sentinel physicians have declined to less than a third of those observed during the peak in early July, and are now approaching baseline levels. In Chile as of September 9, ILI activity is within the range expected for this time of year. In South Africa, laboratories are currently reporting pH1N1 as the dominant influenza subtype; previously, in June and July of this year the dominant subtype was A/H3N2.

**Influenza-Like Illness (ILI) Outbreak Summary Report Form**

*Please complete and email to ilioutbreak@bccdc.ca or fax to (604) 707-2516*

**ILI**: Acute onset of respiratory illness with fever and cough and with one or more of the following: sore throat, arthralgia, myalgia, or prostration which *could* be due to influenza virus. In children under 5, gastrointestinal symptoms may also be present. In patients under 5 or 65 and older, fever may not be prominent.

**Schools and work site outbreak**: greater than 10% absenteeism on any day, most likely due to ILI.

**Residential institutions (facilities) outbreak**: two or more cases of ILI within a seven-day period.

### SECTION A: Reporting Information

- **Person Reporting**: ______________________  **Title**: _____________________________
- **Contact Phone**: ______________________  **Email**: ____________________________
- **Health Authority**: ______________________  **HSDA**: ____________________________
- **Full Facility Name**: ________________________________________________________

Is this report:
- ☐ First Notification *(complete section B below; Section D if available)*
- ☐ Update *(complete section C below; Section D if available)*
- ☐ Outbreak Over *(complete section C below; Section D if available)*

### SECTION B: First Notification

- **Type of facility**:
  - ☐ LTDCF
  - ☐ Acute Care Hospital
  - ☐ Senior’s Residence
    *(if ward or wing, please specify name/number: ______________________ )*
  - ☐ Workplace
  - ☐ School (grades: ________)  ☐ Other ( __________ )

**Date of onset of first case of ILI (dd/mm/yyyy)**: __________ / _______ / ______
