Decreasing Influenza Activity in BC

Highlights

During week 13 (Mar 29 - Apr 4), the rate of ILI visits to sentinel physicians declined to 0.19%, which is within the expected range for this time of year. One lab-confirmed influenza A/H3 outbreak occurred in a LTCF in FHA, and one ILI outbreak (no pathogen identified) occurred in a school in VCHA. Since the start of the season (Sept 28), specimens have been submitted to BCCDC Laboratory Services in relation to 113 ILI outbreak investigations (97 in LTCFs, 10 in ACFs, 4 in schools, 1 in a correctional facility, and 1 in a substance abuse treatment centre). Influenza was identified in 44 (39%) of the investigations (33 in LTCFs, 7 in ACFs, and 4 in schools). Among the 33 influenza outbreaks in LTCFs this season, 29 (88%) were attributed to influenza A/H3, 1 to influenza A/H1, 2 to influenza A (sub-type not available), and 1 to influenza B. Rhino/enterovirus was furthermore identified in 13 (12%) of the investigations, RSV in 7 (6%), human metapneumovirus (HMPV) in 5 (4%), parainfluenza in 3 (3%), coronavirus in 2 (2%), and adenovirus in 1 (1%). No pathogen was identified in the other 38 investigations. (See graph on page 5.)

Please remember to notify BCCDC of any ILI outbreaks occurring in your region by sending an e-mail to iliooutbreak@bccdc.ca and attaching the outbreak report form (a copy is found at the end of this report).

Laboratory Reports

During week 13, BCCDC Laboratory Services tested 134 respiratory specimens. Seventeen (13%) specimens tested positive for influenza A, and 10 (7%) tested positive for influenza B. Of the 17 influenza A specimens received during week 13, 15 (88%) were A/H3 and 2 (12%) were A/H1. An additional 16 specimens tested positive for rhino/enterovirus, 6 for parainfluenza, 4 for HMPV, 3 for RSV, 2 for coronavirus, and 1 for adenovirus.

During week 13, Children's and Women's Health Centre Laboratory tested 64 respiratory specimens. Fourteen (22%) specimens tested positive for parainfluenza, 9 (14%) for RSV, 3 (5%) for adenovirus, 2 (3%) for influenza B, and 1 (2%) for influenza A. (See graphs on page 6.)

To date this season (Apr 7), 76% (665 / 876) of influenza isolates tested at both laboratories have
been type A, and of those sub-typed, 69% (406 / 590) have been A/H3.

**Oseltamivir Resistance**

To date (Apr 7) during the 2008-09 season, BCCDC has assessed 156 A/H1N1 isolates for oseltamivir resistance; 144 show genotypic evidence of oseltamivir resistance, and the other 12 are indeterminate and undergoing further assessment through sequencing of the neuraminidase gene. Thus, all A/H1N1 specimens for which oseltamivir sensitivity could be determined have so far been found resistant to date in BC during the 2008-09 season.

Health care providers considering use of antivirals are advised to consult public health and surveillance updates and to stay informed about influenza activity and resistance patterns throughout the season. The BCCDC has posted interim guidelines, for clinician reference, concerning antiviral options in the context of evolving resistance patterns: [http://www.bccdc.org/downloads/pdf/epid/reports/BC_Interim_Antiviral_Treatment_Guidelines_Influenza.pdf](http://www.bccdc.org/downloads/pdf/epid/reports/BC_Interim_Antiviral_Treatment_Guidelines_Influenza.pdf).

**CANADA**

**FluWatch**

During week 12 (Mar 22-28), influenza activity in Canada decreased slightly. Twenty-four ILI outbreaks were reported: 12 in LTCFs (BC, AB, SK, ON, QC, NB, & NS), 11 in schools (NB), and 1 in a hospital (BC). The proportion of tests that were positive for influenza decreased from 18% in week 11 to 15% in week 12. Since August 24, 2008, provincial/territorial laboratories have detected 7,849 cases of influenza, of which 4,678 (60%) were influenza A and 3,171 (40%) were influenza B. The national rate of ILI visits to sentinel physicians decreased from 28 ILI consultations per 1,000 patient visits in week 11 to 18 ILI consultations per 1,000 patient visits in week 12, which is within the expected range for this time of the season. [http://www.phac-aspc.gc.ca/fluwatch/](http://www.phac-aspc.gc.ca/fluwatch/)

**National Microbiology Laboratory**

Since Sept 1 and as of Apr 2, 751 influenza isolates from provincial and hospital labs have been characterized at the National Microbiology Laboratory (NML):

- 174 A/Brisbane/59/07(H1N1)-like* † from BC, AB, SK, MB, ON, QC, NB, NS, & PEI;
- 138 A/Brisbane/10/07(H3N2)-like* † from BC, AB, SK, MB, ON, QC, NB, PEI, & NL;
- 7 B/Florida/04/06(Yamagata)-like* from AB, ON, & QC;
- 365 B/Malaysia/2506/04(Victoria)-like from all ten provinces;
- and, 67 B/ Brisbane/60/08(Victoria)-like † from BC, SK, MB, ON, QC, and NL.

* indicates a strain match to the 2008-09 vaccine
† indicates a strain match to the 2009-10 vaccine

**Antiviral Resistance**

Drug susceptibility testing at the NML as of Apr 2 indicated that all (n=191) H1N1 isolates tested to date were resistant to oseltamivir, while all H3N2 (n=142) and influenza B (n=409) isolates tested were sensitive to oseltamivir. Of those isolates tested for amantadine resistance, all (n=184) H1N1 isolates were found to be sensitive, and all (n=203) H3N2 isolates were found to be resistant. All 694 (146 H1N1, 139 H3N2, and 409 influenza B) isolates that have been tested for zanamivir resistance were sensitive.

**INTERNATIONAL**

During week 12 (Mar 22-28), influenza activity in the United States continued to decrease. To date this season, US laboratories have detected influenza in 23,849 (14.2%) respiratory specimens, of which 68% were influenza A. Of the influenza A isolates that have been sub-typed, 90% were A/H1. Six hundred and forty-nine of 654 (99%) A/H1 viruses tested this season have been found to be resistant to oseltamivir, and three (1%) A/H1 viruses have been found resistant to adamantanes. For more information, visit: [http://www.cdc.gov/flu/weekly/](http://www.cdc.gov/flu/weekly/).

During week 12 (Mar 22-28), the Russian Federation continued to report high influenza activity, while most other European countries indicated decreasing trends. Of the 27,247 influenza virus detections in Europe since the start of the season (week 40), 87% were influenza A, and of those sub-typed, 90% were A/H3. For more information, visit: [http://www.eiss.org](http://www.eiss.org).

**Avian Influenza**

Since 2003 and to date (Apr 8, 2009), the WHO has confirmed 417 human avian influenza A/H5N1 cases and 257 deaths, with additional recent cases reported in Egypt and Vietnam. For more information on human avian influenza cases, please visit: [http://www.who.int/csr/disease/avian_influenza](http://www.who.int/csr/disease/avian_influenza).
For information on confirmed avian influenza outbreaks in poultry, please visit:

Vaccine Composition
This year’s (2008-09) influenza vaccine contains the following virus antigens:

- A/Brisbane/59/2007(H1N1)-like
- A/Brisbane/10/2007(H3N2)-like
Note: A/Uruguay/716/2007(H3N2) is antigenically equivalent to A/Brisbane/10/2007(H3N2) and may be included by vaccine producers.
- B/Florida/04/2006(Yamagata lineage)-like

The WHO has announced the recommended components of the 2009-10 northern hemisphere influenza vaccines:

- A/Brisbane/59/2007(H1N1)-like
- A/Brisbane/10/2007(H3N2)-like
- B/Brisbane/60/2008(Victoria lineage)-like

Thus, only the B component will be changed from the 2008-09 vaccine. Additional information can be found here:

Activity Level Definitions
Sporadic influenza activity: sporadically occurring ILI and laboratory-confirmed influenza during previous 4 weeks, with no outbreaks.

Localized influenza activity: as for sporadic activity, but with ILI outbreaks in schools and worksites, or laboratory-confirmed influenza outbreaks in residential institutions occurring in less than 50% of the influenza surveillance regions during the week of reporting.

Widespread influenza activity: as for localized activity, but with outbreaks occurring in greater than or equal to 50% of the influenza surveillance regions during the week of reporting.

List of Acronyms
ACF: Acute Care Facility
AI: Avian Influenza
FHA: Fraser Health Authority
HMPV: Human metapneumovirus
HSDA: Health Service Delivery Area
IHA: Interior Health Authority
ILI: Influenza-Like Illness
LTCF: Long Term Care Facility
MSP: BC Medical Services Plan
NHA: Northern Health Authority
NML: National Microbiological Laboratory
OIE: World Organization for Animal Health
RSV: Respiratory syncytial virus
VCHA: Vancouver Coastal Health Authority
VIHA: Vancouver Island Health Authority
WHO: World Health Organization

**WEEKLY SENTINEL ILI**

Percentage of Patient Visits due to Influenza Like Illness (ILI) per Week Compared to Average Percentage of ILI Visits for the Past 19 Seasons Sentinel Physicians, British Columbia, 2008-2009

- 2008/2009 season
- 1989/90 to 2007/08 seasons (Average +/- (2 standard units))

**ILI OUTBREAKS**

Number of Influenza-Like Illness (ILI) Outbreaks Investigated or Reported, Compared to Current ILI Rate and Average ILI Rate for past 19 years, per Week British Columbia, 2008-2009

* Influ LTCF = Long-term care facility, influenza identified
* Other LTCF = Long-term care facility, other pathogen identified (including RSV, parainfluenza, adenovirus, and rhino/enterovirus)
* ILI (No Pathogen) LTCF = Long-term care facility, no pathogen identified
LABORATORY SUMMARY

Virus Isolates and Percentage of Respiratory Specimens Submitted to BC Provincial Laboratory Diagnosed Positive for a Virus, per Week
British Columbia, 2008-2009

Virus Isolates and Percentage of Respiratory Specimens Submitted to Children and Women's Health Centre Laboratory Diagnosed Positive for a Virus, per Week, British Columbia, 2008-2009
**Influenza-Like Illness (ILI) Outbreak Summary Report Form**

*Please complete and email to ilioutbreak@bccdc.ca or fax to (604) 660-0197*

**ILI**: Acute onset of respiratory illness with fever and cough and with one or more of the following: sore throat, arthralgia, myalgia, or prostration which *could* be due to influenza virus. In children under 5, gastrointestinal symptoms may also be present. In patients under 5 or 65 and older, fever may not be prominent.

**Schools and work site outbreak**: greater than 10% absenteeism on any day, most likely due to ILI.

**Residential institutions (facilities) outbreak**: two or more cases of ILI within a seven-day period.
