In weeks 20-22 (May 17 – June 6), the proportion of patients presenting to sentinel physicians with ILI was within the expected range for this time of year. One lab-confirmed influenza A/H3N2 outbreak was reported in a LTCF in FHA during week 21. Two percent (10/604) of respiratory specimens tested at BCCDC during weeks 20-22 were positive for human influenza viruses, and 6% (37/604) were positive for swine-origin influenza (s-oiv) H1N1. There is indication of increase in the percentage of total respiratory specimens submitted to the BC Provincial Laboratory testing positive for s-oiv H1N1 over the past 3 weeks. Other Canadian provinces and the US likewise report continued increases in the percentage of specimens positive for s-oiv H1N1. This suggests atypical seasonality and continued s-oiv activity for which further increase should be considered.

### Sentinel Physicians
During weeks 20-22, the proportion of patients presenting to sentinel physicians with ILI decreased, returning to the expected range for this time of year. As previously explained, the surge in ILI activity during weeks 17-19 may at least in part be attributed to heightened public awareness of swine-origin influenza virus (s-oiv) in late April and early May, which may have induced care-seeking among patients with mild illness who would not otherwise present to a physician. (See graph on page 4.)

### MSP
Influenza illness as a proportion of all submitted BC Medical Services Plan (MSP) claims also decreased during weeks 20-22. As of June 11, activity levels throughout the province, as measured by MSP claims, have returned to levels near or below the historical median. (See graphs on pages 4-6.)

### ILI Outbreaks
One influenza A/H3N2 outbreak was reported in an FHA LTCF during week 21. Since April 20, when public health partners were first informed of the evolving situation in Mexico, specimens have been submitted to BCCDC Laboratory Services in relation to 26 ILI outbreak investigations (17 in LTCFs, 4 in schools, 2 in ACFs, 2 in correctional facilities, and 1 in a workplace). Influenza A/H3N2 was identified in 4 of the investigations (all LTCFs), s-oiv H1N1 was identified in 2 (one school and one correctional facility), influenza B in 1 school, HMPV in 2 LTCFs, rhino/enterovirus in 1 LTCF, and coronavirus in a workplace. No pathogen was identified in the other 15. (See graph on page 6.)

Please remember to notify BCCDC of any ILI outbreaks occurring in your region by sending an e-mail to ilioutbreak@bccdc.ca and attaching the outbreak report form (a copy is found at the end of this report).

### Laboratory Reports
BCCDC Laboratory Services tested 604 respiratory specimens in weeks 20-22. Nine (1%) specimens tested positive for human influenza A/H3N2, 0 tested positive for human influenza A/H1N1, 1 (<1%) tested positive for human influenza B, and 37 (6%) tested positive for s-oiv H1N1. Other respiratory pathogens detected included: rhino/enterovirus (6% of specimens tested), RSV (2%), parainfluenza (2%), HMPV (1%), coronavirus (<1%), and adenovirus (<1%).
During weeks 20-22, Children’s and Women’s Health Centre Laboratory tested 132 respiratory specimens. Fourteen percent tested positive for para-influenza, 2% for adenovirus, 2% for RSV, and 2% for s-oiv H1N1. (See graphs on page 7.)

**Swine-origin influenza H1N1**
For up-to-date information on confirmed cases of swine influenza in Canada, visit:
BC-specific information, including resources for healthcare professionals, is available here: http://www.bccdc.org/news.php?item=290

**FluWatch**
During weeks 20 and 21, most regions of Canada reported sporadic influenza activity. In week 21 the proportion of positive tests increased to 8.5%, and the ILI consultation rate was 24 per 1000 patient visits, both of which are higher than expected for this time of year. http://www.phac-aspc.gc.ca/fluwatch/

Other Canadian provinces, including Ontario and Quebec, have recently reported increasing proportions of respiratory specimen tests positive for s-oiv H1N1: 17% of specimens tested from April 25 to June 5 in Quebec and 30% of specimens tested during the last week of May in Ontario were positive for s-oiv H1N1. For details see: http://www.sante.gouv.qc.ca/sujets/prob_sante/influenza/index.php?Flash_influenza
http://www.health.gov.on.ca/english/providers/program/pubhealth/flu/flu_08/flubul_mn.html

**National Microbiology Laboratory**
Since Sept 1 and as of June 12, 953 influenza isolates from provincial and hospital labs have been characterized at the National Microbiology Laboratory (NML):
241 A/Brisbane/59/07(H1N1)-like* † from BC, AB, SK, MB, ON, QC, NB, NS, & PEI;
164 A/Brisbane/10/07(H3N2)-like* † from BC, AB, SK, MB, ON, QC, NB, PEI, & NL;
11 B/Florida/04/06(Yamagata)-like* from AB, ON, QC, & NB;
373 B/Malaysia/2506/04(Victoria)-like from all ten provinces;
176 B/ Brisbane/60/08(Victoria)-like † from BC, AB, SK, MB, ON, QC, NB, NS;
And, 56 A/California/07/2009-like§ from BC, AB, SK, MB, ON, QC, NB, NS;
* indicates a strain match to the 2008-09 vaccine
† indicates a strain match to the 2009-10 vaccine
§ A/California/07/2009 (H1N1) is the variant reference virus (s-oiv) selected by WHO as a potential candidate for a novel influenza A/H1N1 vaccine.

**Antiviral Resistance**
Drug susceptibility testing at the NML as of June 10 indicated that most (n=290) human influenza A/H1N1 isolates tested to date were resistant to oseltamivir (one human H1N1 isolate identified since mid-April was sensitive). All human H3N2 (n=182), influenza B (n=566), and s-oiv H1N1 (n=77) isolates were found to be sensitive to oseltamivir when tested. Of those isolates tested for amantadine resistance, all (n=257) human H1N1 isolates were found to be sensitive, all (n=305) human H3N2 isolates were found to be resistant, and all (n=83) s-oiv H1N1 isolates were found to be resistant. All 875 (240 human H1N1, 179 human H3N2, 566 influenza B, and 28 s-oiv H1N1) isolates that have been tested for zanamivir resistance were sensitive.

**INTERNATIONAL**
Influenza activity levels in the United States during week 21 remained higher than usual for this time of year, with 31% of respiratory specimens testing positive for influenza, and 97% of those influenza detections s-oiv H1N1. Influenza activity in Europe remains at low, end-of-season level; however, s-oiv H1N1 detections continue to increase in several countries. Details are available at: http://www.cdc.gov/flu/weekly/ and http://www.eis.org .

The international situation concerning s-oiv H1N1 is rapidly evolving. As of June 11, 74 countries have reported 28,774 cases of s-oiv H1N1, which includes 144 deaths. Given the rapid spread of this novel virus, the WHO announced on June 11 that it has raised the pandemic alert level from phase 5 to phase 6. For the most up-to-date information, visit the WHO website at: http://www.who.int/csr/disease/swineflu/en/index.html
Avian Influenza
Since 2003 and to date (June 2, 2009), the WHO has confirmed 433 human avian influenza A/H5N1 cases and 262 deaths. For more information on human avian influenza cases, please visit: http://www.who.int/csr/disease/avian_influenza.

Vaccine Composition
This year’s (2008-09) influenza vaccine contains the following virus antigens:
• A/Brisbane/59/2007(H1N1)-like
• A/Brisbane/10/2007(H3N2)-like
  Note: A/Uruguay/716/2007(H3N2) is antigenically equivalent to A/Brisbane/10/2007(H3N2) and may be included by vaccine producers.
• B/Florida/04/2006(Yamagata lineage)-like

The WHO has announced the recommended components of the 2009-10 northern hemisphere influenza vaccines:
• A/Brisbane/59/2007(H1N1)-like
• A/Brisbane/10/2007(H3N2)-like
• B/Brisbane/60/2008(Victoria lineage)-like
Thus, only the B component will be changed from the 2008-09 vaccine. Additional information can be found here: http://www.who.int/csr/disease/influenza/recommendations2009_10north/en/index.html.

Influenza-Like Illness (ILI) Outbreak Summary Report Form
Please complete and email to ilioutbreak@bccdc.ca or fax to (604) 660-0197

**ILI:** Acute onset of respiratory illness with fever and cough and with one or more of the following: sore throat, arthralgia, myalgia, or prostration which could be due to influenza virus. In children under 5, gastrointestinal symptoms may also be present. In patients under 5 or 65 and older, fever may not be prominent.

**Schools and work site outbreak:** greater than 10% absenteeism on any day, most likely due to ILI.

**Residential institutions (facilities) outbreak:** two or more cases of ILI within a seven-day period.

**SECTION A: Reporting Information**

Person Reporting: ______________________  Title: _____________________________
Contact Phone: ______________________  Email: ____________________________
Health Authority: ______________________  HSDA: ____________________________
Full Facility Name: __________________________________________________________

Is this report:
- ☐ First Notification (complete section B below; Section D if available)
- ☐ Update (complete section C below; Section D if available)
- ☐ Outbreak Over (complete section C below; Section D if available)

**SECTION B: First Notification**

Type of facility:
- ☐ LTCF
- ☐ Acute Care Hospital
- ☐ Senior’s Residence
- ☐ Workplace
- ☐ School (grades:_______)
- ☐ Other ( ________)

(if ward or wing, please specify name/number:____________________)

Date of onset of first case of ILI (dd/mm/yyyy): __________ /_______ / ______

<table>
<thead>
<tr>
<th>Numbers to date</th>
