In weeks 23-24 (June 7-20), the proportion of patients presenting to sentinel physicians with ILI increased above the expected range for this time of year. A similar increase was observed in Medical Services Plan claims for influenza illness, particularly in the lower mainland region. No ILI outbreaks were reported during this period. One percent (5/385) of respiratory specimens tested at the BC Provincial Laboratory during weeks 23-24 were positive for human influenza viruses, whereas 21% (79/385) were positive for swine-origin influenza (s-oiv) H1N1, indicating an increase in percentage of specimens positive for s-oiv over the past 3 weeks. This suggests atypical seasonality and continued s-oiv activity for which further increase should be considered.

Sentinel Physicians
During weeks 23-24, the percentage of patients presenting to sentinel physicians with ILI increased from 0.03% in week 23 to 0.34% in week 24. As previously explained, the surge in ILI activity during weeks 17-19 may at least in part be attributed to heightened public awareness of swine-origin influenza virus (s-oiv) in late April and early May, which may have induced care-seeking among patients with mild illness who would not otherwise present to a physician. It is uncertain to what degree this phenomenon may explain the more recent increase in weeks 23-24. (See graph on page 4.)

MSP
Influenza illness as a proportion of all submitted BC Medical Services Plan (MSP) claims also increased slightly over this period (weeks 23-24). As shown in the regional graphs below, this increase was apparent in VCHA and FHA but not in the other RHAs. (See graphs on pages 4-6.)

ILI Outbreaks
No ILI outbreaks were reported during weeks 23-24. Since April 20, when public health partners were first informed of the evolving situation in Mexico, specimens have been submitted to BCCDC Laboratory Services in relation to 27 ILI outbreak investigations (18 in LTCFs, 4 in schools, 2 in ACFs, 2 in correctional facilities, and 1 in a workplace). Influenza A/H3N2 was identified in 4 of the investigations (all LTCFs), s-oiv H1N1 was identified in 2 (one school and one correctional facility), influenza B in 1 school, HMPV in 2 LTCFs, rhino/enterovirus in 1 LTCF, and coronavirus in a workplace. No pathogen was identified in the other 16. (See graph on page 6.)

Please remember to notify BCCDC of any ILI outbreaks occurring in your region by sending an e-mail to illoutbreak@bccdc.ca and attaching the outbreak report form (a copy is found at the end of this report).

Laboratory Reports
BCCDC Laboratory Services tested 385 respiratory specimens in weeks 23-24. Five (1%) specimens tested positive for human influenza viruses (2 human influenza A/H1, 1 A/H3, and 2 B). Seventy-nine (21%) tested positive for s-oiv H1N1. Other respiratory pathogens detected included: rhino/enterovirus (3% of specimens tested), parainfluenza (1%), and HMPV (1%).
During weeks 23-24, Children’s and Women’s Health Centre Laboratory tested 56 respiratory specimens. Thirteen percent tested positive for parainfluenza, 5% for s-ovi H1N1, 4% for adenovirus, and 4% for RSV. (See graphs on page 7.)

**Swine-origin influenza H1N1**
For up-to-date information on confirmed cases of swine influenza in Canada, visit: http://www.phac-aspc.gc.ca/alert-alerte/swine-porcine/surveillance-eng.php

BC-specific information, including resources for healthcare professionals, is available here: http://www.bccdc.ca/resourcematerials/newsandalerts/healthalerts/H1N1FluVirusHumanSwineFlu.htm

**INTERNATIONAL**
In the United States, influenza activity levels decreased during week 23 but remained higher than usual for this time of year, with 39% of respiratory specimens testing positive for influenza, and over 98% of those influenza detections s-ovi H1N1. Influenza activity in Europe remains at low, end-of-season level; however, s-ovi H1N1 detections continue to increase in several countries. Details are available at: http://www.cdc.gov/flu/weekly/ and http://www.eiss.org .

For up-to-date information on s-ovi H1N1 globally, visit the WHO website at: http://www.who.int/csr/disease/swineflu/en/index.html

**Avian Influenza**
Since 2003 and to date (June 2, 2009), the WHO has confirmed 433 human avian influenza A/H5N1 cases and 262 deaths. For more information on human avian influenza cases, please visit: http://www.who.int/csr/disease/avian_influenza

**Vaccine Composition**
This year’s (2008-09) influenza vaccine contains the following virus antigens:
- A/Brisbane/59/2007(H1N1)-like
- A/Brisbane/10/2007(H3N2)-like
- B/Brisbane/60/2008(Victoria)-like

Note: A/Uruguay/716/2007(H3N2) is antigenically equivalent to A/Brisbane/10/2007(H3N2) and may be included by vaccine producers.

- B/Florida/04/2006(Yamagata lineage)-like

The WHO has announced the recommended components of the 2009-10 northern hemisphere influenza vaccines:
- A/Brisbane/59/2007(H1N1)-like
- A/Brisbane/10/2007(H3N2)-like
- B/Brisbane/60/2008(Victoria lineage)-like
Thus, only the B component will be changed from the
2008-09 vaccine. Additional information can be found
here:
http://www.who.int/csr/disease/influenza/recommendations2

BY REGIONAL HEALTH AUTHORITY (RHA) – CURRENT TO JUNE 25, 2009
ILI OUTBREAKS

Number of Influenza-Like Illness (ILI) Outbreaks Investigated or Reported, Compared to Current ILI Rate and Average ILI Rate for past 19 years, per Week
British Columbia, 2008-2009

* Influ LTCF = Long-term care facility, influenza identified
* Other LTCF = Long-term care facility, other pathogen identified (including RSV, parainfluenza, adenovirus, and rhino/enterovirus)
* ILI (No Pathogen) LTCF = Long-term care facility, no pathogen identified
**LABORATORY SUMMARY**

Virus Detections and Percentage of Respiratory Specimens Submitted to BC Provincial Laboratory Diagnosed Positive for Human Influenza and S-OIV A/H1N1, per Week, British Columbia, 2008-2009

*Note:* The increase in bars during weeks 17-19 above reflects the large surge in specimens submitted to BCCDC for testing (2594 specimens were tested, a 5-fold increase over the number of tests performed during the 3-week period of peak activity this season).

Virus Detections and Percentage of Respiratory Specimens Submitted to Children and Women's Health Centre Laboratory Diagnosed Positive for a Virus, per Week, British Columbia, 2008-2009
Influenza-Like Illness (ILI) Outbreak Summary Report Form

Please complete and email to ilioutbreak@bccdc.ca or fax to (604) 660-0197

ILI: Acute onset of respiratory illness with fever and cough and with one or more of the following: sore throat, arthralgia, myalgia, or prostration which could be due to influenza virus. In children under 5, gastrointestinal symptoms may also be present. In patients under 5 or 65 and older, fever may not be prominent.

Schools and work site outbreak: greater than 10% absenteeism on any day, most likely due to ILI.
Residential institutions (facilities) outbreak: two or more cases of ILI within a seven-day period.

SECTION A: Reporting Information

Person Reporting: ______________________  Title: _____________________________
Contact Phone: ______________________  Email: ____________________________
Health Authority: ______________________  HSDA: ____________________________
Full Facility Name: __________________________________________________________

Is this report:  □ First Notification (complete section B below; Section D if available)
□ Update (complete section C below; Section D if available)
□ Outbreak Over (complete section C below; Section D if available)

SECTION B: First Notification

Type of facility:  □ LTCF  □ Acute Care Hospital  □ Senior’s Residence
(if ward or wing, please specify name/number: ______________________)
□ Workplace  □ School (grades:_______  )  □ Other ( _________ )

Date of onset of first case of ILI (dd/mm/yyyy): __________ /_______ / ______

<table>
