In week 13 (March 28 – April 3), influenza activity in BC remained below expected levels, while other respiratory viruses continued to circulate. The proportion of patients presenting to sentinel physicians with ILI and the proportion of Medical Services Plan claims for influenza illness both remained lower than expected for this time of year. No influenza outbreaks were reported. At the BC Provincial Laboratory, 1% (1/135) of respiratory specimens received during week 13 was positive for pH1N1, while 21% of specimens tested for other respiratory viruses were positive for human metapneumovirus, 19% for rhino/enterovirus, and 7% for RSV. Of 79 specimens tested at BC Children’s Hospital Laboratory, none were positive for influenza, and 25% were positive for RSV. Continued sporadic cases of pH1N1 are not unexpected, and similar sporadic detections have been observed in recent weeks in other provinces. To date, there is no evidence of resurgence in community pH1N1 outbreak activity in BC. However, clinicians should keep pH1N1 in mind, including appropriate testing and early treatment among high-risk patients or those with clinically severe presentations of acute respiratory illness. Vaccination against pH1N1 is the most effective means of prevention, and public health measures (hand hygiene, cough etiquette, self-isolation) remain important as always to underscore.
Sentinel Physicians

During week 13, 0.2% of patients presenting to sentinel physicians had ILI, which is below the expected range for this time of year. Forty-seven percent (24/51) of sentinel physician sites have reported to-date for week 13.

Percentage of Patient Visits due to Influenza Like Illness (ILI) per Week Compared to Average Percentage of ILI Visits for the Past 19 Seasons
Sentinel Physicians, British Columbia, 2009-2010

BC Children’s Hospital Emergency Room

Eight percent of ER visits at BC Children’s Hospital were attributed to “fever and cough” or flu-like illness in week 13, which is comparable to percentages in the previous 2 weeks (7-9%).

Percentage of Patients Presenting to BC Children’s Hospital ER with Presenting Complaint of “Flu,” “Influenza,” or “Fever/Cough”, by Week

Source: BCCH Admitting, discharge, transfer database, ADT
Data provided by Decision Support Services at Children’s & Women’s Health Centre of BC
Medical Services Plan
Influenza illness as a proportion of all submitted BC Medical Services Plan (MSP) claims remained low in the last week, consistent with the decrease over the past few months, and below the expected range for this time of year. Proportions in all 5 RHAs remain near the 10-year minimums. To better reveal current low-level trends, the ~9% peak in MSP claims of late October/early November is not shown in the graphs below (consult earlier bulletins).

* Influenza illness is tracked as the percentage of all submitted MSP general practitioner claims with ICD-9 code 487 (influenza).

Notes: MSP week 27 Sep 2009 corresponds to sentinel ILI week 39.
Data current to April 6, 2010
**Laboratory Reports**

One hundred thirty-five respiratory specimens were submitted for testing at the BC Provincial Laboratory in week 13. One (1%) was positive for pH1N1; no other influenza viruses were detected. Since week 35 (September 1, 2009), >99% of all influenza detections in BC have been pH1N1. To date, detections of other seasonal influenza viruses over the same period have been limited (12 out of 6565 influenza detections in total). In week 13, of 135 specimens tested for other respiratory viruses, 28 (21%) tested positive for human metapneumovirus, 25 (19%) for rhino/enterovirus, 9 (7%) for RSV, 3 (2%) for coronavirus, 2 (1%) for human bocavirus, 1 (1%) for adenovirus, and 1 (1%) for parainfluenza.

Recent detections of pH1N1 now tally a cumulative total of 10 since the last week of January, all since March 5, 2010. Continued sporadic cases of pH1N1 are not unexpected, and similar sporadic detections have been observed in recent weeks in other provinces (see graph on page 7). To date, there is no evidence of resurgence in community pH1N1 outbreak activity in BC. Nevertheless, clinicians should keep pH1N1 in mind, including appropriate testing and early treatment among high-risk patients or those with clinically severe presentations of acute respiratory illness. Vaccination against pH1N1 is the most effective means of prevention, and public health measures (hand hygiene, cough etiquette, self-isolation) are worth underscoring with patients.
During week 13, BC Children’s and Women’s Health Centre Laboratory tested 79 respiratory specimens. None were positive for influenza. Twenty (25%) specimens tested positive for RSV, 1 (1%) for adenovirus, and 1 (1%) for parainfluenza.

Influenza and Other Virus Detections Among Respiratory Specimens Submitted to BC Children’s and Women’s Health Centre Laboratory, 2009-2010

ILI Outbreaks
No influenza outbreaks (facilities) or school ILI outbreaks were reported in BC during week 13.
Pandemic H1N1 (pH1N1) Severe Outcomes
One additional pH1N1 hospitalization was reported in the past week, for a total of 4 incident pH1N1 hospitalizations in BC in the last month. More than 1000 pH1N1 hospitalizations and >50 pH1N1 deaths have been reported in the province to-date, since April 2009. Sixty-five percent of hospitalized cases have had at least one reported underlying medical condition (excluding pregnancy). Twenty-six percent of hospitalized cases have been admitted to the ICU, and 8% have died.

For details see pH1N1 Surveillance Update: www.bccdc.ca/dis-cond/DiseaseStatsReports/influSurveillanceReports.htm (bottom of page)

**CANADA**

**FluWatch**
During week 12 (Mar 21-27), influenza activity in Canada remained low for the 14th consecutive week. The sentinel ILI rate was 21 per 1000 patient-visits, which is below the expected range for this time of year. Less than one percent of respiratory specimens tested nationally were positive for influenza, compared to 18% positivity for RSV. Nationally reported RSV positivity peaked in week 7 (28%). Of the 7 influenza detections reported in Canada in week 12, 3 were pH1N1, 3 were non-subtyped influenza A, and 1 was influenza B. www.phac-aspc.gc.ca/fluwatch/

As illustrated below, while overall lab positivity for influenza has been low (<2%) across Canada since January 2010, recent sporadic detections of pH1N1 and seasonal influenza have occurred in BC as well as other provinces.

**Influenza detections in Canada, Jan-Mar 2010**

![Influenza detections in Canada, Jan-Mar 2010](chart)

**Source:** FluWatch (www.phac-aspc.gc.ca/fluwatch/)

**National Microbiology Laboratory (NML): Antiviral Resistance**
Drug susceptibility testing at the NML between September 1, 2009 and March 30, 2010 indicated that 99% (1056/1068) of pH1N1 isolates were sensitive to oseltamivir. All influenza B isolates (n=4) and influenza A/H3N2 isolates (n=13) tested were sensitive to oseltamivir, and the 6 seasonal A/H1N1 isolates tested were oseltamivir-resistant. All pH1N1 (n=1046), seasonal H1N1 (n=2), A/H3N2 (n=13), and influenza B (n=4) isolates were sensitive to zanamivir. All pH1N1 (n=1123) and A/H3N2 (n=24) isolates were resistant to amantadine. Four seasonal H1N1 isolates were sensitive to amantadine, and one was resistant. Global surveillance has shown that circulating pH1N1 viruses are resistant to amantadine but remain sensitive to zanamivir and oseltamivir, although sporadic cases of oseltamivir resistance have been observed worldwide.
NML: Strain Characterization
Between September 1, 2009 and March 31, 2010, 860 influenza isolates (843 pandemic H1N1 and 17 seasonal influenza) were collected from provincial and hospital labs and characterized at the NML:
- 843 A/California/07/2009 (H1N1)-like from BC, AB, SK, MB, ON, QC, NB, NS, PEI, & NT;
- 3 A/Brisbane/59/2007 (H1N1)-like from AB & QC;
- 2 A/Brisbane/10/2007 (H3N2)-like from BC & QC;
- 8 A/Perth/16/2009 (H3N2)-like from BC, AB, & QC;
- 2 B/Brisbane/60/2008 (Victoria lineage)-like from ON;
- 1 B/Florida/04/2006 (Yamagata lineage)-like from QC;
- 1 B/Malaysia/2506/2004 (Victoria lineage)-like from ON.

INTERNATIONAL
During week 12 (March 21-27), influenza activity generally remained low in the United States, with ongoing regional activity in some areas (i.e., the Southeast). Four percent (97/2775) of respiratory specimens tested in reference laboratories were positive for influenza. 98% (59/60) of subtyped influenza A viruses were pH1N1. One influenza A/H3 virus was detected. The proportion of sentinel physician visits due to ILI remained low (1.6%) and below the national baseline. [www.cdc.gov/flu/weekly/](http://www.cdc.gov/flu/weekly/)

In Europe, all countries reported low-level influenza activity for the week of March 22-28. Eight percent of sentinel laboratory samples were positive for influenza, consistent with the decrease observed in previous weeks. Of 24 sentinel influenza detections across Europe from March 22-28, 12 were influenza B, 12 were influenza A, and all (9) of the sub-typed influenza A viruses were pH1N1. [www.eiss.org](http://www.eiss.org)

Globally, while pH1N1 activity has continued to decrease or remain low in most countries in the temperate zone of the Northern Hemisphere, influenza B activity has increased in parts of Asia and Europe, including China, Mongolia, Japan, Korea, Hong Kong, Philippines, Thailand, Vietnam, Indonesia, Bangladesh, Australia, Iran, the Russian Federation, Sweden, and Italy (indicating global spread, including westward). Of the influenza B viruses which were further characterized in recent weeks, the majority belonged to the Victoria lineage (i.e., matching lineage of 2009-10 vaccine influenza B component). Little influenza activity has been reported to-date in 2010 in temperate regions of the southern hemisphere. [www.who.int/csr/don/2010_04_01/en/index.html](http://www.who.int/csr/don/2010_04_01/en/index.html)

WHO Recommendations for 2010-11 Northern Hemisphere Influenza Vaccine
On February 18, the WHO announced the recommended strain components for the 2010-11 Northern Hemisphere trivalent influenza vaccine:
- A/California/7/2009 (H1N1)-like virus
- A/Perth/16/2009 (H3N2)-like virus
- B/Brisbane/60/2008 (Victoria lineage)-like virus

A/California/7/2009 (H1N1) is the recommended component for pandemic H1N1 vaccines produced and administered in 2009-10. The recommended H3N2 virus has changed from the previous year’s vaccine (A/Brisbane/10/2007), while the recommended B virus remains unchanged (B/Brisbane/60/2008). Influenza-Like Illness (ILI) Outbreak Summary Report Form

Please complete and email to ilioutbreak@bccdc.ca or fax to (604) 707-2516

ILI: Acute onset of respiratory illness with fever and cough and with one or more of the following: sore throat, arthralgia, myalgia, or prostration which could be due to influenza virus. In children under 5, gastrointestinal symptoms may also be present. In patients under 5 or 65 and older, fever may not be prominent.

Schools and work site outbreak: greater than 10% absenteeism on any day, most likely due to ILI.

Residential institutions (facilities) outbreak: two or more cases of ILI within a seven-day period.

SECTION A: Reporting Information

Person Reporting: ______________________ Title: _____________________________
Contact Phone: ______________________ Email: ____________________________
Health Authority: ______________________ HSDA: ____________________________
Full Facility Name: __________________________________________________________

Is this report: □ First Notification (complete section B below; Section D if available)
□ Update (complete section C below; Section D if available)
□ Outbreak Over (complete section C below; Section D if available)

SECTION B: First Notification

Type of facility: □ LTCF      □ Acute Care Hospital      □ Senior’s Residence
(if ward or wing, please specify name/number: ____________________________ )
□ Workplace      □ School (grades: _________ )      □ Other ( _________ )

Date of onset of first case of ILI (dd/mm/yyyy): __________ / _______ / ______

<table>
