Low influenza activity in BC; recent A/H3N2 detection by sentinel physicians and one school outbreak in week 49

Summary

During week 49 (December 5 – December 11), influenza activity in BC remained low. Sentinel physician and MSP indicators were consistent with the low levels observed in previous weeks. At the BC Provincial Laboratory, 74 respiratory specimens were tested, 9 (12%) of which were positive for rhino/enterovirus. Five (7%) cases of influenza A (3 A/H3N2, 2 unsubtyped) were detected from Northern Interior, four of them submitted from a school outbreak and one submitted by a sentinel physician. Conversely, of 42 specimens tested at BC Children’s Hospital Laboratory, none was positive for influenza. Other respiratory viruses were sporadically detected at both labs during this period. In combination, these findings suggest some recent community A/H3N2 activity in BC, particularly in the northern parts of the province, that is still at low levels but requires monitoring for further possible increase in the weeks to come.

Report disseminated December 17, 2010
Contributors: Lisan Kwindt, Samson Chan, Naveed Janjua, Danuta Skowronski
Sentinel Physicians
During week 49, less than 0.2% of patients presenting to sentinel physicians had ILI, which is below the expected range for this time of year. Fifty-five percent (26/47) of sentinel physician sites have reported to-date for week 49.

BC Children’s Hospital Emergency Room
The percentage of BC Children’s Hospital ER visits attributed to “fever and cough” or flu-like illness increased to slightly below 5% towards the end of this period but remains consistent with levels observed in previous seasons.
Medical Services Plan
Influenza illness as a proportion of all submitted BC Medical Services Plan (MSP) claims also remained low during this past week. Proportions in all RHAs remained at or below historical medians. To better reveal current low-level trends, the ~9% peak in MSP claims of late October/early November 2009 is not shown in the graphs below (consult earlier bulletins).

Influenza Illness Claims* British Columbia

* Influenza illness is tracked as the percentage of all submitted MSP general practitioner claims with ICD-9 code 487 (influenza).

Notes: MSP week 28 Nov, 2010 corresponds to sentinel ILI week 48.
Data current to Dec 14, 2010
Laboratory Reports
Seventy-four respiratory specimens were tested at the BC Provincial Laboratory in week 49. Five (7%) were positive for influenza A (3 H3N2, 2 unsubtyped); four in children and one in an adult. All of these specimens were reported from Northern Interior; four from a school outbreak and one from a sentinel, indicating influenza H3 activity in the community. No specimen was positive for pandemic H1N1 or influenza B in week 49. In this week, of 74 specimens tested for other respiratory viruses, 9 (12%) tested positive for rhino/enterovirus, 2 (3%) for adenovirus, and 5 (7%) for parainfluenza. Although other respiratory viruses may still be making greater contribution to acute febrile respiratory illness in BC, the recent detection of community influenza activity warrants monitoring for further possible increase in the weeks to come.

During week 49, BC Children’s and Women’s Health Centre Laboratory tested 42 respiratory specimens. None were positive for influenza. Nine specimens (21.4%) were positive for RSV, one (2.4%) for parainfluenza, and 4 (9.5%) for adenovirus.
ILI Outbreaks

During week 49, three ILI outbreaks were reported by long-term care facilities (LTCF) in the province, but no influenza was identified. Laboratory testing identified parainfluenza in all three. One laboratory-confirmed influenza A/H3N2 outbreak was reported from a school in Northern Interior in week 49. Six specimens were tested and four were positive for influenza A; 2 were A/H3N2 and 2 are as yet unsubtyped.

Number of Influenza and Influenza-Like Illness (ILI) Outbreaks Reported, Compared to Current Sentinel ILI Rate and Average Sentinel ILI Rate for past 19 years, per Week, British Columbia, 2010-2011 season

* Facility influenza outbreak defined as 2 or more ILI cases within 7-day period, with at least one case laboratory-confirmed as influenza.
† School ILI outbreak defined as >10% absenteeism on any day, most likely due to ILI.

FluWatch

During the week ending December 11, 2010, influenza activity in Canada continued to increase, particularly in some regions of the Prairies, Ontario and Quebec. The influenza-like illness (ILI) consultation rate remained within the expected range for this time of year. Three hundred twenty-three specimens (out of 3,000 or 10.8%) tested positive for influenza in week 49, an increase from the previous week (8.25%): 79 A/H3N2, 228 unsubtyped influenza A, 5 pandemic H1N1, and 11 influenza B. Those specimens were reported from ON, QC, MB, AB, SK, and BC. Influenza A activity was mainly concentrated in ON, QC and MB. During week 49, 13 new paediatric hospitalizations and 16 new adult hospitalizations related to influenza were reported through IMPACT and CNISP networks. This is an increase over previous weeks. www.phac-aspc.gc.ca/fluwatch/

National Microbiology Laboratory (NML): Strain Characterization

Between September 1 and December 16, 2010, sixty-six influenza isolates were collected from provincial and hospital labs and characterized at the NML:
- 50 A/Perth/16/2009 (H3N2)-like* from QC, ON, MN, AB & BC;
- 3 A/California/07/2009 (H1N1)-like* from ON;
- 13 B/Brisbane/60/2008 (Victoria lineage)-like† from QC, ON, SK, AB & BC;

* indicates a strain match to the recommended H3N2 component of the 2010-11 northern hemisphere trivalent influenza vaccine
† indicates a strain match to the recommended H1N1 component of the 2010-11 northern hemisphere trivalent influenza vaccine

NML: Antiviral Resistance

Drug susceptibility testing at the NML between September 1 and December 16, 2010 indicated that all A/H3N2 and pandemic H1N1 isolates were resistant to amantadine. All the isolates tested for zanamivir (34 A/H3N2, 3 pH1N1, 11 type B) and oseltamivir resistance (39 A/H3N2, 3 pH1N1, 11 type B) showed susceptibility.
INTERNATIONAL

**Northern Hemisphere:** During the week ending December 11, 2010, influenza activity increased in the United States [http://www.cdc.gov/flu/weekly/](http://www.cdc.gov/flu/weekly/). Three hundred sixty three specimens (out of 3,295, or 11.0%) tested positive for influenza in week 49: 11 pandemic H1N1, 95 A/H3, 88 unsubtyped influenza A, and 169 type B. The proportion of ILINet physician visits for ILI was 1.8%, which was below the national baseline of 2.5%. The CDC further reported that the proportion of deaths attributed to pneumonia and influenza was below the epidemic threshold in the USA. A swine origin triple reassortant A/H3N2 case was reported in Minnesota, the latest to be reported since the two cases in week 44. The cases are not epidemiologically linked, and all have been associated with contact with pigs.

Most countries in Europe continued to report low ILI activity, with a mix of A/H3N2, pandemic H1N1, and type B identified. As of December 17, the United Kingdom reported an increase in influenza activity with primary care ILI rate above the base line thresholds in England. Pandemic influenza A/ H1N1 and influenza B are the predominant circulating viruses. Fifty-six percent of specimens from patients with ILI presenting to sentinel GPs in England in week 49 were reported as positive for influenza. The rise in the number of reported cases in the community has been accompanied by reports of patients with serious illness requiring hospitalization and numerous outbreaks of flu in schools across the country. The virus strains circulating are well matched to the current influenza vaccine. Russia and Bulgaria reported medium level of circulation of unspecified respiratory disease. In East Asia, China, Japan and the Republic of Korea reported low influenza activity. Northern China reported an increase of positive cases of influenza (primarily A/H3N2) in late October to mid November 2010 but the ILI rate remained low. In Mongolia, the rate of A/H3N2 increased in mid to late November which increased the ILI rate above the seasonal threshold, suggesting that the local winter influenza season had begun. **WHO Recommendations for 2010-11 Northern Hemisphere Influenza Vaccine**

On February 18, the WHO announced the recommended strain components for the 2010-11 Northern Hemisphere trivalent influenza vaccine:

- A/California/7/2009 (H1N1)-like virus
- A/Perth/16/2009 (H3N2)-like virus
- B/Brisbane/60/2008 (Victoria lineage)-like virus

A/California/7/2009 (H1N1) was the recommended component for pandemic H1N1 vaccines produced and administered in 2009-10. The recommended H3N2 virus has changed from the previous year’s vaccine (A/Brisbane/10/2007), while the recommended B virus remains unchanged (B/Brisbane/60/2008). Influenza-Like Illness (ILI) Outbreak Summary Report Form

Please complete and email to ilioutbreak@bccdc.ca or fax to (604) 707-2516

ILI: Acute onset of respiratory illness with fever and cough and with one or more of the following: sore throat, arthralgia, myalgia, or prostration which could be due to influenza virus. In children under 5, gastrointestinal symptoms may also be present. In patients under 5 or 65 and older, fever may not be prominent.

Schools and work site outbreak: greater than 10% absenteeism on any day, most likely due to ILI.

Residential institutions (facilities) outbreak: two or more cases of ILI within a seven-day period.

SECTION A: Reporting Information

Person Reporting: ______________________  Title: _____________________________
Contact Phone: ______________________  Email: ____________________________
Health Authority: ______________________  HSDA: ____________________________
Full Facility Name: __________________________________________________________

Is this report:  □ First Notification (complete section B below; Section D if available)
□ Update (complete section C below; Section D if available)
□ Outbreak Over (complete section C below; Section D if available)

SECTION B: First Notification

Type of facility:  □ LTCF  □ Acute Care Hospital  □ Senior’s Residence
(if ward or wing, please specify name/number: _________________________________)
□ Workplace  □ School (grades:_______)  □ Other (__________)

Date of onset of first case of ILI (dd/mm/yyyy): __________ / _______ / ______
