Low-level influenza activity in BC

Summary

In weeks 6-8 (February 5-25, 2012), most influenza surveillance indicators, including sentinel physician reporting, MSP claims and ER consultations at BC Children’s Hospital, pointed to only low-level influenza activity in BC. Fourteen school ILI outbreaks were reported from Interior and Vancouver Coastal Health Authorities and two lab-confirmed outbreaks were reported from long term care facilities, one in Vancouver Island HA in week 6 (A/H3N2) and one in Fraser HA in week 8 (influenza A, subtype pending). Of four hundred and nineteen specimens tested at the BC Public Health Microbiology & Reference Laboratory, PHSA, during this period, 48 (11.5%) influenza positives were detected, including 32 (7.6%) influenza A/H3N2, 9 (2.1%) influenza A(H1N1)pdm09, 2 (0.5%) influenza A (subtype pending), and 6 (1.4%) influenza B. Other respiratory viruses made greater contribution to laboratory detections than influenza including rhino/enterovirus (54/419, 12.9%), respiratory syncytial virus (47/419, 11.2%), human metapneumovirus (30/419, 7.2%), and coronavirus (24/419, 5.7%). RSV continued to dominate among the respiratory viruses detected at BC Children’s Hospital.
Sentinel Physicians
In weeks 6-8, the proportion of patients with IIL among those presenting to sentinel physicians ranged from 0.25 to 0.45%, slightly lower compared to the previous weeks and well below the expected range for this time of year. 57% to 72% of sentinel physician sites have reported for weeks 6-8 to-date.

BC Children's Hospital Emergency Room
The percentage of BC Children's Hospital ER visits attributed to “fever and cough” or flu-like illness in weeks 6-8 was around 5.5%, similar to previous weeks and slightly lower than the expected level for this time of year.

Data provided by Decision Support Services at Children’s & Women’s Health Centre of BC
Medical Services Plan
In weeks 6-8, influenza illness as a proportion of all submitted BC Medical Services Plan (MSP) claims continued to be below the ten-year 25th percentile level for this time of year throughout BC.

Influenza Illness Claims* British Columbia

* Influenza illness is tracked as the percentage of all submitted MSP general practitioner claims with ICD-9 code 487 (influenza).

Data provided by Population Health Surveillance and Epidemiology, BC Ministry of Health Services

Notes: MSP week beginning 28 August 2011 corresponds to sentinel ILI week 35; Data current to 27 February 2012

Northern
Laboratory Reports
During weeks 6-8, other respiratory viruses made greater contribution to laboratory detections at the BC Public Health Microbiology & Reference Laboratory, PHSA, than influenza. Of the four hundred and nineteen respiratory specimens tested at the provincial lab in weeks 6-8, forty-eight (11.5%) were positive for influenza. This includes 32 (7.6%) influenza A/H3N2 from all HAs, 9 (2.1%) influenza A(H1N1)pdm09 from Fraser, Interior and Vancouver Coastal HAs, 2 (0.5%) influenza A (subtype pending), and 6 (1.4%) influenza B from Fraser and Vancouver Coastal HAs. Of 419 specimens tested for other respiratory viruses, significant detections included rhino/enterovirus (54/419, 12.9%), respiratory syncytial virus (47/419, 11.2%), human metapneumovirus (30/419, 7.2%), and coronavirus (24/419, 5.7%). Other respiratory viruses were also sporadically detected.

In weeks 6-8, BC Children’s and Women’s Health Centre Laboratory tested 326 respiratory specimens: 25 (7.7%) were positive for influenza virus, similar to the previous week, including 17 influenza A (subtype pending) and 8 influenza B. RSV continued to predominate among the other respiratory viruses detected (121/326, 37.1%). Other respiratory viruses were also detected at low levels.
ILI Outbreaks
In weeks 6-8, fourteen ILI outbreaks were reported from schools in Interior HA (9) and Vancouver Coastal HA (5). In addition, two lab-confirmed influenza A outbreaks were also reported from long-term care facilities, including one in Vancouver Island HA in week 6 (influenza A/H3N2) and one in Fraser HA in week 8 (influenza A, subtype pending).

FluWatch
In weeks 6-7 (February 5 to 18, 2012), influenza activity in Canada continued to increase gradually; activity remained low in the Territories and in a few other regions across the country. The proportion of tests positive for influenza in weeks 6-7 continued to increase compared to the previous weeks. Of the total positive influenza detections, around 60% were influenza A and ~40% were influenza B; A/H3N2 continued to predominate among subtyped influenza A detections; influenza A(H1N1)pdm09 was also detected at a lower level. The ILI consultation rates in weeks 6-7 were slightly lower compared to the previous week, and remained within the expected levels for this time of year. PHAC further reported 23 laboratory-confirmed influenza-associated paediatric hospitalizations, including 8 influenza A-associated (un-subtyped) and 14 influenza B-associated. There was also one new influenza B-associated adult death (age > 65 years) reported in week 6, which brought the accumulated adult deaths in Canada this season to 5 (all influenza B-associated). www.phac-aspc.gc.ca/fluwatch/

National Microbiology Laboratory (NML): Strain Characterization
Between September 1, 2011 and March 1, 2012, 4,435 isolates were collected from provincial and hospital labs and characterized at the NML as follows:

107 A/Perth/16/2009-like (H3N2)* from QUE, ONT, SASK, ALTA, and BC;
84 A/California/07/09-like (H1N1)* from NB, QUE, ONT, SASK, ALTA, and BC;
136 B/Brisbane/60/2008-like (B/Victoria/02/87 lineage)† from NFLD, NB, QUE, ONT, SASK, ALTA, BC;
116 B/Wisconsin/01/2010-like (recent B Yamagata lineage) from NB, QUE, ONT, ALTA, and BC;

* indicates a strain match to the recommended H3N2 component of the 2011-12 northern hemisphere influenza vaccine
† indicates a strain match to the recommended H1N1 component for the 2011-2012 northern hemisphere influenza vaccine
NML: Antiviral Resistance
From September 1, 2011 to March 1, 2012, drug susceptibility testing was performed at the NML for influenza A/H3N2 (oseltamivir 103; zanamivir: 98; amantadine: 144), influenza A(H1N1)pdm09 (oseltamivir: 79; zanamivir: 61; amantadine: 92), and influenza B isolates (oseltamivir: 199; zanamivir: 150). The results indicated that all isolates were sensitive to oseltamivir and zanamivir, while all influenza A/H3N2 isolates but one, and all A(H1N1)pdm09 isolates, were resistant to amantadine.

INTERNATIONAL
USA: in week 7, ending 18 February, 2012, influenza activity in the United States increased slightly, but remained relatively low. Six hundred and fourteen (14.4%) specimens tested were positive for influenza, including 576 influenza A [264 A/H3N2, 86 A(H1N1)pdm09, and 226 un-subtyped A] and 38 influenza B. The proportion of outpatient visits for ILI was 1.9% which was below the national baseline of 2.4%. The proportion of all deaths due to pneumonia and influenza illness was 7.3%, slightly below the epidemic threshold of 7.9% for this time of the year. No paediatric deaths were reported in week 7 in USA.

WHO news: (last updated on 17 February 2012) Northern Hemisphere: Influenza activity in the temperate regions of the northern hemisphere remained low overall. It continued to increase in the United States and Canada though overall activity was low. Some countries in Western Europe, North Africa, and northern China appeared to have reached peak transmission but activity continued to increase in Eastern Europe. The levels of both mild and severe disease were relatively low compared to previous years in most areas reporting. The most commonly detected virus type or subtype throughout the northern hemisphere temperate zone was influenza A/H3N2 with the exception of China, which reported a predominance of influenza B, and Mexico, where influenza A(H1N1)pdm09 was the predominant subtype circulating. Tropics and Southern Hemisphere: Countries in the tropical zone reported low levels of influenza activity with the exception of a few countries of the Americas and parts of southern Asia. Influenza activity in the temperate countries of the southern hemisphere remained at inter-seasonal levels.

Avian Influenza:
According to WHO between February 21 and February 28, 2012, five new confirmed cases of human infection with avian influenza A/H5N1 virus were reported from the Ministry of Health and Population of Egypt and Indonesia: four cases from Egypt (two fatal and two recovered after hospitalization); one fatal case from Indonesia. The cumulative deaths in 2012 have reached 8 out of the total of 11 cases reported. For details please see: www.who.int/influenza/human_animal_interface/avian_influenza/en/

WHO Recommendations for 2012-13 Northern Hemisphere Influenza Vaccine
On 23 February, 2012 the WHO announced the recommended strain components for the 2012-13 northern hemisphere vaccine:
A/California/7/2009 (H1N1)pdm09 virus
A/Victoria/361/2011 (H3N2)-like virus*
B/Wisconsin/1/2010 (Yamagata lineage)-like virus*
* these two of the three recommended components are different from the northern hemisphere seasonal TIV vaccines produced and administered in 2010-11 and 2011-2012. For further details, see:

# Influenza-Like Illness (ILI) Outbreak Summary Report Form

Please complete and email to ilioutbreak@bccdc.ca

Note: This form is for provincial surveillance purposes. Please notify your local health unit per local guidelines/requirements.

ILI: Acute onset of respiratory illness with fever and cough and with one or more of the following: sore throat, arthralgia, myalgia, or prostration which could be due to influenza virus. In children under 5, gastrointestinal symptoms may also be present. In patients under 5 or 65 and older, fever may not be prominent.

**Schools and work site outbreak:** greater than 10% absenteeism on any day, most likely due to ILI.

**Residential institutions (facilities) outbreak:** two or more cases of ILI within a seven-day period.

Is this report:
- [ ] First Notification ([complete section B below; Section D if available])
- [ ] Update ([complete section C below; Section D if available])
- [ ] Outbreak Over ([complete section C below; Section D if available])

## First Notification

**Type of facility:**
- [ ] LTCF
- [ ] Acute Care Hospital
- [ ] Senior’s Residence
  
  (if ward or wing, please specify name/number: ________________)
- [ ] Workplace
- [ ] School (grades: __________)
- [ ] Other (___________)

**Date of onset of first case of ILI (dd/mm/yyyy):** __________

<table>
