Summary

During week 2 (6 to 12 January 2013), influenza activity in BC remained high and by most indicators, increased slightly. The proportion of patients with influenza-like illness among those presenting to sentinel physicians increased significantly from the previous week, rising above the expected range for this time of year. Across most of the province, the proportion of medical visits with an influenza diagnosis continued to increase over the previous week, compared to the same period during the prior ten years. We continue to observe a large volume of ILI (including confirmed influenza A) outbreaks in long-term care facilities. During week 2, more than a third (38.8%) of the specimens tested at the BC Public Health Microbiology & Reference Laboratory were positive for influenza, predominately A/H3N2. At BC Children’s and Women’s Health Centre Laboratory, the influenza positive rate remained similar to the previous week. Consultations for influenza-like illness at BC Children’s Hospital emergency room dropped compared to the previous week but remained higher than recent seasons.

Report disseminated January 17, 2013
Contributors: Helen Gulyun Li, Lisan Kwindt, Naveed Janjua, Danuta Skowronski
British Columbia

Sentinel Physicians

In week 2, the proportion of patients with influenza-like illness (ILI) among those presenting to sentinel physicians increased significantly (to 1.03%), rising above the expected range for this time of year. To date, 68% of sentinel physician sites have reported for week 2.

**British Columbia**

**BC Children’s Hospital Emergency Room**

The proportion of BC Children’s Hospital ER visits attributed to “fever and cough” or flu-like illness dropped from 23.8% in week 1 to 17.1% in week 2, but remained above that of recent prior seasons.

---

* Data subject to change as reporting becomes increasingly complete.
† Historical values exclude 2006-09 and 2009-10 seasons due to atypical seasonality.

**Source:** BCCH Admitting, discharge, transfer database, ADT

**Note:** Data from 2010-11 and 2011-12 is based on new system (Triage Chief Complaint) not directly comparable to data for 2009-10. In bulletins before week 9 of 2011-12 season, data is based on old system.
Medical Services Plan
During week 2, influenza illness as a proportion of all submitted BC Medical Services Plan (MSP) claims continued to increase provincially and in each Health Authority except Northern. The proportions entered the range of 10-year maximum in FHA, VCHA and at the provincial level and above the 10-year 75% percentile in VIHA, NHA and IHA for this time of year (noting variability around those classifications per below).

Influenza Illness Claims* British Columbia

* Influenza illness is tracked as the percentage of all submitted MSP general practitioner claims with ICD-9 code 487 (influenza).

Notes:  MSP week beginning 1 August 2012 corresponds to sentinel ILI week 31; Data current to 08 January 2013.
In week 2, 508 specimens were tested for influenza viruses at the BC Public Health Microbiology & Reference Laboratory, PHSA, of which 197 (38.8%) were positive for influenza, including 181 influenza A from all Health Authorities [72 A/H3N2, 4 A(H1N1)pdm09, 105 A (subtype pending)], and 16 influenza B. Among other respiratory viruses, RSV continued to be the most common detection (39/508, 7.7%). Other respiratory viruses were also sporadically detected. Influenza thus remains the most likely cause of acute respiratory illness for which testing was undertaken during week 2. However, the recent high level of influenza positives may partially reflect the clustering of specimens submitted from facility outbreaks.

In week 2, BC Children’s and Women’s Health Centre Laboratory tested 125 respiratory specimens, of which 21 (16.8%) were positive for influenza viruses (similar to the previous week), including 20 influenza A (un-subtyped) and 1 influenza B. RSV (26/125, 20.8%) was the most common detection. Other respiratory viruses were also sporadically detected.

Data provided by Virology Department at Children’s & Women’s Health Centre of BC
ILI Outbreaks

During week 2, 15 ILI outbreaks were reported from long-term care facilities (LTCF), including 9 lab-confirmed influenza A (FHA: 3; IHA: 1; VCHA: 2, VIHA: 3), and six with negative or pending lab result. One school ILI outbreak was reported from IHA in week 2. In the beginning of week 3, five ILI outbreaks from LTCFs (1 influenza A in FHA; the rest pending lab result) and seven from schools (IHA: 4; NHA: 2, VCHA: 1) have been reported. To date, 50 lab-confirmed influenza outbreaks have thus been reported from LTCFs in BC in the current season since week 40 (30 September 2012), with 72% of these outbreaks reported since week 52 (23 December 2012).

FluWatch

In week 1 (December 30, 2012 to January 11, 2013), testing volume has increased and the percentage of positive laboratory tests for influenza has declined slightly. More regions across Canada reported widespread and localized influenza activity and the number of LTCF influenza outbreaks increased significantly compared to the previous week. A total of 3864 (32.4%) laboratory detections of influenza were reported, of which 98.1% were for influenza A viruses, predominantly A/H3N2. The ILI consultation rate was above the expected range for this time of year. [www.phac-aspc.gc.ca/fluwatch/](http://www.phac-aspc.gc.ca/fluwatch/)

National Microbiology Laboratory (NML): Strain Characterization

From September 1, 2012 to Jan. 17, 2013, 248 isolates were collected from provincial and hospital labs and characterized at the NML as follows:

- 172 A/Victoria/361/2011-like (H3N2)† from NFLD, PEI, NB, QUE, ONT, MAN, SASK, ALTA and BC;
- 36 A/California/07/2009-like* from NB, ONT and SASK;
- 9 B/Brisbane/60/2008-like** from QUE, ONT, MAN, and SASK;
- 31 B/Wisconsin/01/2010-like† from NB, QUE, ONT, SASK and BC;

* indicates a strain match to the recommended H1N1 component for the 2012-2013 northern hemisphere influenza vaccine.
† belongs to the B Yamagata lineage, and is the recommended influenza B component for the 2012-2013 northern hemisphere influenza vaccine.
†† indicates a strain match to the recommended H3N2 component for the 2012-2013 northern hemisphere influenza vaccine.
** belongs to the B Victoria lineage, which was the recommended influenza B component for the 2011-2012 northern hemisphere influenza vaccine.
NML: Antiviral Resistance
From September 1, 2012 to January 17, 2013, drug susceptibility testing was performed at the NML for influenza A/H3N2 (oseltamivir: 163; zanamivir: 162; amantadine: 306), A(H1N1)pdm09 (oseltamivir: 25; zanamivir: 25; amantadine: 27), and influenza B isolates (oseltamivir: 26; zanamivir: 26). The results indicated that all isolates were sensitive to oseltamivir and zanamivir, while all influenza A isolates were resistant to amantadine.

Updated Antiviral Guidance
For your information, updated antiviral guidance of the Association of Medical Microbiology and Infectious Disease Canada (AMMI Canada) entitled “The use of antiviral drugs for influenza: Guidance for practitioners 2012/2013” is now available from the following websites, and includes updated dosing guidance of which clinicians should be aware for their patients with reduced creatinine clearance:
www.ammi.ca/guidelines

INTERNATIONAL
USA: during week 1 (December 30, 2012 to January 5, 2013), influenza activity remained elevated, but may be decreasing in some areas. The proportion of outpatient visits for influenza-like illness was 4.3% which is above the national baseline of 2.2% but lower than the previous week. The percentage of specimens testing positive is also showing signs of decline; 4222 (32.8%) influenza viruses were detected, including 79.8% influenza A viruses [52.9% A/H3N2, 1.1% A(H1N1)pdm09, and 46.0% un-subtyped A], and 20.2% influenza B. The US CDC’s weekly influenza surveillance report is available at:
www.cdc.gov/flu/weekly.

Europe: in week 1 of 2013, ECDC (http://ecdc.europa.eu/en/publications/Publications/Forms/ECDC_DispForm.aspx?ID=1031) reported increasing influenza trends in 16 of 20 countries. Influenza transmission and geographic spread was most active in northern and western Europe. The percentage of sentinel specimens testing positive for influenza remained high. Since week 40, of the influenza virus detections in sentinel specimens, 44% were type A, and 56% were type B viruses. Of influenza A viruses subtyped, 51% were A/H3N2 and 49% were A/H1N1.

No new report has been released by the WHO since 7 January 2013.

WHO Recommendations for 2012-13 Northern Hemisphere Influenza Vaccine
On 23 February 2012, the WHO announced the recommended strain components for the 2012-13 northern hemisphere vaccine:
A/California/7/2009 (H1N1)pdm09 virus
A/Victoria/361/2011 (H3N2)-like virus*
B/Wisconsin/1/2010 (Yamagata lineage)-like virus*
* these two of the three recommended components are different from the northern hemisphere seasonal TIV vaccines produced and administered in 2010-11 and 2011-2012. For further details, see:

Influenza-Like Illness (ILI) Outbreak Summary Report Form

Please complete and email to ilioutbreak@bccdc.ca

Note: This form is for provincial surveillance purposes. Please notify your local health unit per local guidelines/requirements.

ILI: Acute onset of respiratory illness with fever and cough and with one or more of the following: sore throat, arthralgia, myalgia, or prostration which could be due to influenza virus. In children under 5, gastrointestinal symptoms may also be present. In patients under 5 or 65 and older, fever may not be prominent.

Schools and work site outbreak: greater than 10% absenteeism on any day, most likely due to ILI.

Residential institutions (facilities) outbreak: two or more cases of ILI within a seven-day period.

### Reporting Information

Health unit/medical health officer notified? □ Yes □ No

Person Reporting: ____________________ Title: ____________________

Contact Phone: ____________________ Email: ____________________

Health Authority: ____________________ HSDA: ____________________

Full Facility Name: _________________________________________________

Is this report: □ First Notification (complete section B below; Section D if available)

□ Update (complete section C below; Section D if available)

□ Outbreak Over (complete section C below; Section D if available)

### First Notification

Type of facility: □ LTCF □ Acute Care Hospital □ Senior’s Residence

(if ward or wing, please specify name/number: ____________________)

□ Workplace □ School (grades: ) □ Other (___________)

Date of onset of first case of ILI (dd/mm/yyyy): DD / MMM / YYYY
