Infectious Syphilis

1. Infectious Syphilis case reports in BC by month

Preliminary data and subject to change
2. Infectious Syphilis case Reports in BC by health authority

Preliminary data and subject to change

Note: Excludes missing and unknown geography. Due to reporting delays, geographic trends should be interpreted with caution.
3. Infectious Syphilis case reports in BC by gender

Preliminary data and subject to change

Note: Gender is based on the gender variable values collected in Intrahealth Profile EMR which is structured as male, female, transgender and unknown. Data shown reflects male, female, and transgender responses only.
4. Infectious Syphilis case reports in BC by age group

Preliminary data and subject to change

Note: Excludes cases where age could not be calculated due to missing date of birth.
Syphilis Testing Episodes

5.a. Syphilis non-prenatal testing episodes* and percent positivity in BC by month - total

Preliminary data and subject to change

*Testing episode = 30-day window (see technical appendix for further details).

Note: Percent positivity is calculated as the number of infectious syphilis cases over testing episodes, where a testing episode is defined as a 30-day window.
5.b. Syphilis non-prenatal testing episodes* and percent positivity in BC by month - female

Preliminary data and subject to change

*Testing episode = 30-day window (see technical appendix for further details).

Note: Percent positivity is calculated as the number of infectious syphilis cases over testing episodes, where a testing episode is defined as a 30-day window.

-The number of female syphilis non-prenatal testing episodes is based on sex reported on the laboratory requisition. The number of female infectious syphilis cases is based on gender variable values collected in Intrahealth Profile EMR.
5.c. Syphilis non-prenatal testing episodes* and percent positivity in BC by month - male

Preliminary data and subject to change

*Testing episode = 30-day window (see technical appendix for further details).

Note: Percent positivity is calculated as the number of infectious syphilis cases over testing episodes, where a testing episode is defined as a 30-day window.

-The number of male syphilis non-prenatal testing episodes is based on sex reported on the laboratory requisition. The number of male infectious syphilis cases is based on gender variable values collected in Intrahealth Profile EMR.
Chlamydia

6. Genital and Extra-genital Chlamydia case reports in BC by month

Preliminary data and subject to change

Note: Interior Health Authority (IHA) had put some of their communicable disease reporting tasks on hold for the period of 16 December 2022 to 9 January 2023. During this time, data entry of Chlamydia, Gonorrhea and non-acute HCV cases was paused. As such, Chlamydia, Gonorrhea and HCV cases in IHA are not complete for December 2022 in this report, and data trends should be interpreted with caution.
7. Genital Chlamydia case reports in BC by health authority

Preliminary data and subject to change

Note: Excludes missing and unknown geography.

-Interior Health Authority (IHA) had put some of their communicable disease reporting tasks on hold for the period of 16 December 2022 to 9 January 2023. During this time, data entry of Chlamydia, Gonorrhea and non-acute HCV cases was paused. As such, Chlamydia, Gonorrhea and HCV cases in IHA are not complete for December 2022 in this report, and data trends should be interpreted with caution.
8. Genital Chlamydia case reports in BC by gender

Preliminary data and subject to change

Note: Gender is based on the gender variable values collected in Intrahealth Profile EMR which is structured as male, female, transgender and unknown. Data shown reflects male, female, and transgender responses only.

- Interior Health Authority (IHA) had put some of their communicable disease reporting tasks on hold for the period of 16 December 2022 to 9 January 2023. During this time, data entry of Chlamydia, Gonorrhea and non-acute HCV cases was paused. As such, Chlamydia, Gonorrhea and HCV cases in IHA are not complete for December 2022 in this report, and data trends should be interpreted with caution.
9. Extra-genital Chlamydia case reports in BC by gender

Preliminary data and subject to change

Note: Gender is based on the gender variable values collected in Intrahealth Profile EMR which is structured as male, female, transgender and unknown. Data shown reflects male, female, and transgender responses only.

-Interior Health Authority (IHA) had put some of their communicable disease reporting tasks on hold for the period of 16 December 2022 to 9 January 2023. During this time, data entry of Chlamydia, Gonorrhea and non-acute HCV cases was paused. As such, Chlamydia, Gonorrhea and HCV cases in IHA are not complete for December 2022 in this report, and data trends should be interpreted with caution.
Preliminary data and subject to change

Note: Excludes cases where age could not be calculated due to missing date of birth.

-Interior Health Authority (IHA) had put some of their communicable disease reporting tasks on hold for the period of 16 December 2022 to 9 January 2023. During this time, data entry of Chlamydia, Gonorrhea and non-acute HCV cases was paused. As such, Chlamydia, Gonorrhea and HCV cases in IHA are not complete for December 2022 in this report, and data trends should be interpreted with caution.
Gonorrhea

11. Genital and Extra-genital Gonorrhea case reports in BC by month

Preliminary data and subject to change

Note: Interior Health Authority (IHA) had put some of their communicable disease reporting tasks on hold for the period of 16 December 2022 to 9 January 2023. During this time, data entry of Chlamydia, Gonorrhea and non-acute HCV cases was paused. As such, Chlamydia, Gonorrhea and HCV cases in IHA are not complete for December 2022 in this report, and data trends should be interpreted with caution.
12. Genital Gonorrhea case reports in BC by health authority

Preliminary data and subject to change

Note: Excludes missing and unknown geography.

- Interior Health Authority (IHA) had put some of their communicable disease reporting tasks on hold for the period of 16 December 2022 to 9 January 2023. During this time, data entry of Chlamydia, Gonorrhea and non-acute HCV cases was paused. As such, Chlamydia, Gonorrhea and HCV cases in IHA are not complete for December 2022 in this report, and data trends should be interpreted with caution.
Preliminary data and subject to change

Note: Gender is based on the gender variable values collected in Intrahealth Profile EMR which is structured as male, female, transgender and unknown. Data shown reflects male, female, and transgender responses only.

- Interior Health Authority (IHA) had put some of their communicable disease reporting tasks on hold for the period of 16 December 2022 to 9 January 2023. During this time, data entry of Chlamydia, Gonorrhea and non-acute HCV cases was paused. As such, Chlamydia, Gonorrhea and HCV cases in IHA are not complete for December 2022 in this report, and data trends should be interpreted with caution.
14. Extra-genital Gonorrhea case reports in BC by gender

Preliminary data and subject to change

Note: Gender is based on the gender variable values collected in Intrahealth Profile EMR which is structured as male, female, transgender and unknown. Data shown reflects male, female, and transgender responses only.

- Interior Health Authority (IHA) had put some of their communicable disease reporting tasks on hold for the period of 16 December 2022 to 9 January 2023. During this time, data entry of Chlamydia, Gonorrhea and non-acute HCV cases was paused. As such, Chlamydia, Gonorrhea and HCV cases in IHA are not complete for December 2022 in this report, and data trends should be interpreted with caution.
Preliminary data and subject to change

Note: Excludes cases where age could not be calculated due to missing date of birth.

-Interior Health Authority (IHA) had put some of their communicable disease reporting tasks on hold for the period of 16 December 2022 to 9 January 2023. During this time, data entry of Chlamydia, Gonorrhea and non-acute HCV cases was paused. As such, Chlamydia, Gonorrhea and HCV cases in IHA are not complete for December 2022 in this report, and data trends should be interpreted with caution.
16. New HIV diagnoses in BC by month

Preliminary data and subject to change

Note: There will be a delay in HIV surveillance data while we work on surveillance system data flows and validation. We hope to provide more current data as soon as possible. Until then, data are provided to November 2022 (inclusive).
17. New HIV diagnoses in BC by health authority

Preliminary data and subject to change

Note: Excludes missing and unknown geography.

-There will be a delay in HIV surveillance data while we work on surveillance system data flows and validation. We hope to provide more current data as soon as possible. Until then, data are provided to November 2022 (inclusive).
18. New HIV diagnoses in BC by sex

Preliminary data and subject to change

Note: Sex is based on the gender variable values collected in the HIV/AIDS Information System and the sex variable values collected in the laboratory information system. Data shown reflects male and female responses only.

-There will be a delay in HIV surveillance data while we work on surveillance system data flows and validation. We hope to provide more current data as soon as possible. Until then, data are provided to November 2022 (inclusive).
19. New HIV diagnoses in BC by age group

Preliminary data and subject to change

Note: Excludes cases where age could not be calculated due to missing date of birth.

-There will be a delay in HIV surveillance data while we work on surveillance system data flows and validation. We hope to provide more current data as soon as possible. Until then, data are provided to November 2022 (inclusive).
HIV Testing Episodes

20.a. HIV non-prenatal testing episodes* and percent positivity in BC by month - total

Preliminary data and subject to change

*Testing episode = 30-day window (see technical appendix for further details).

Note: Percent positivity is calculated as the number of HIV cases over testing episodes, where a testing episode is defined as a 30-day window.

-There will be a delay in HIV surveillance data while we work on surveillance system data flows and validation. We hope to provide more current data as soon as possible. Until then, data are provided to November 2022 (inclusive).
20.b. HIV non-prenatal testing episodes* and percent positivity in BC by month - female

Preliminary data and subject to change

*Testing episode = 30-day window (see technical appendix for further details).

Note: Percent positivity is calculated as the number of HIV cases over testing episodes, where a testing episode is defined as a 30-day window.

-The number of female HIV cases is based on the gender variable values collected on the HIV case report form and the sex variable reported on the laboratory requisition.

-There will be a delay in HIV surveillance data while we work on surveillance system data flows and validation. We hope to provide more current data as soon as possible. Until then, data are provided to November 2022 (inclusive).
20.c. HIV non-prenatal testing episodes* and percent positivity in BC by month - male

Preliminary data and subject to change

*Testing episode = 30-day window (see technical appendix for further details).

Note: Percent positivity is calculated as the number of HIV cases over testing episodes, where a testing episode is defined as a 30-day window.

-The number of male HIV cases is based on the gender variable values collected on the HIV case report form and the sex variable reported on the laboratory requisition.

-There will be a delay in HIV surveillance data while we work on surveillance system data flows and validation. We hope to provide more current data as soon as possible. Until then, data are provided to November 2022 (inclusive).
Hepatitis C

21. New Hepatitis C cases in BC by month

![Graph showing hepatitis C cases by month from Jan 2020 to Dec 2022]

Preliminary data and subject to change

Note: Interior Health Authority (IHA) had put some of their communicable disease reporting tasks on hold for the period of 16 December 2022 to 9 January 2023. During this time, data entry of Chlamydia, Gonorrhea and non-acute HCV cases was paused. As such, Chlamydia, Gonorrhea and HCV cases in IHA are not complete for December 2022 in this report, and data trends should be interpreted with caution.
22. New Hepatitis C cases in BC by health authority

Preliminary data and subject to change

Note: Excludes missing and unknown health authority geography.

- The large number of correctional facilities in Fraser Health may attribute Hepatitis C cases to Fraser Health when the cases’ permanent residence may be outside of Fraser Health.

- Interior Health Authority (IHA) had put some of their communicable disease reporting tasks on hold for the period of 16 December 2022 to 9 January 2023. During this time, data entry of Chlamydia, Gonorrhea and non-acute HCV cases was paused. As such, Chlamydia, Gonorrhea and HCV cases in IHA are not complete for December 2022 in this report, and data trends should be interpreted with caution.
23. New Hepatitis C cases in BC by sex

Preliminary data and subject to change

Note: Sex is based on the sex variable values collected in the laboratory information system. Data shown reflects male and female responses only.

- Interior Health Authority (IHA) had put some of their communicable disease reporting tasks on hold for the period of 16 December 2022 to 9 January 2023. During this time, data entry of Chlamydia, Gonorrhea and non-acute HCV cases was paused. As such, Chlamydia, Gonorrhea and HCV cases in IHA are not complete for December 2022 in this report, and data trends should be interpreted with caution.
24. New Hepatitis C cases in BC by age group

Preliminary data and subject to change

Note: Excludes cases where age could not be calculated due to missing date of birth.

-Interior Health Authority (IHA) had put some of their communicable disease reporting tasks on hold for the period of 16 December 2022 to 9 January 2023. During this time, data entry of Chlamydia, Gonorrhea and non-acute HCV cases was paused. As such, Chlamydia, Gonorrhea and HCV cases in IHA are not complete for December 2022 in this report, and data trends should be interpreted with caution.
Hepatitis C Antibody Testing Episodes

25.a. HCV antibody testing episodes* and percent positivity in BC by month - total

Preliminary data and subject to change

*Antibody testing episode = 1-day window (see technical appendix for further details).

Note: Percent positivity is calculated as the number of HCV cases over antibody testing episodes, where an antibody testing episode is defined as a 1-day window.

-Interior Health Authority (IHA) had put some of their communicable disease reporting tasks on hold for the period of 16 December 2022 to 9 January 2023. During this time, data entry of Chlamydia, Gonorrhea and non-acute HCV cases was paused. As such, Chlamydia, Gonorrhea and HCV cases in IHA are not complete for December 2022 in this report, and data trends should be interpreted with caution.
25.b. HCV antibody testing episodes* and percent positivity in BC by month - female

Preliminary data and subject to change

*Antibody testing episode = 1-day window (see technical appendix for further details).

Note: Percent positivity is calculated as the number of HCV cases over antibody testing episodes, where an antibody testing episode is defined as a 1-day window.

-The number of female HCV antibody testing episodes is based on sex reported on the laboratory requisition. The number of female HCV cases is based on the sex variable values collected in the laboratory information system.

-Interior Health Authority (IHA) had put some of their communicable disease reporting tasks on hold for the period of 16 December 2022 to 9 January 2023. During this time, data entry of Chlamydia, Gonorrhea and non-acute HCV cases was paused. As such, Chlamydia, Gonorrhea and HCV cases in IHA are not complete for December 2022 in this report, and data trends should be interpreted with caution.
25.c. HCV antibody testing episodes* and percent positivity in BC by month - male

Preliminary data and subject to change

*Antibody testing episode = 1-day window (see technical appendix for further details).

Note: Percent positivity is calculated as the number of HCV cases over antibody testing episodes, where an antibody testing episode is defined as a 1-day window.

-The number of male HCV antibody testing episodes is based on sex reported on the laboratory requisition. The number of male HCV cases is based on the sex variable values collected in the laboratory information system.

-Interior Health Authority (IHA) had put some of their communicable disease reporting tasks on hold for the period of 16 December 2022 to 9 January 2023. During this time, data entry of Chlamydia, Gonorrhea and non-acute HCV cases was paused. As such, Chlamydia, Gonorrhea and HCV cases in IHA are not complete for December 2022 in this report, and data trends should be interpreted with caution.
Active Tuberculosis

26. Active tuberculosis case reports in BC by month

Preliminary data and subject to change
27. Active tuberculosis case reports in BC by health authority

Preliminary data and subject to change

Note: Excludes missing and unknown geography.
28. Active tuberculosis case reports in BC by sex

Preliminary data and subject to change

Note: Sex is based on the gender variable values collected in Panorama. Data shown reflects male and female responses only.
29. Active tuberculosis case reports in BC by age group

Preliminary data and subject to change

Note: Excludes cases where age could not be calculated due to missing date of birth.
Technical Appendix

Case data: This report contains preliminary data on infectious syphilis, chlamydia, gonorrhea, HIV, HCV, and active tuberculosis. Provincial counts and geographic distribution of cases are expected to change with improvement in data quality and algorithms.

Testing data: This report contains non-prenatal HIV and syphilis testing (that is, tests not flagged as a prenatal test) conducted by the BCCDC Public Health Laboratory (PHL). The BCCDC PHL performs >95% of all screening tests for HIV and HCV, and >99% of all tests for syphilis. A test episode for syphilis and HIV consists of all tests for that infection conducted for an individual in a 30-day period (as follow-up or simultaneous test may be required to clarify test results within this period, for example). A test episode for HCV consists of all HCV antibody tests conducted for an individual in a 1-day period.

Data Sources

Infectious Syphilis case data: Data extracted from STIBBI Data Mart (source system = STIIS) and Intrahealth Profile EMR

Syphilis testing episodes: Data extracted from STIBBI Data Mart

Chlamydia: Data extracted from STIBBI Data Mart (source system = STIIS and Panorama) and Intrahealth Profile EMR

Gonorrhea: Data extracted from STIBBI Data Mart (source system = STIIS and Panorama) and Intrahealth Profile EMR

HIV case data: Data extracted from STIBBI Data Mart (source system = HAISYS)

HIV testing episodes: Data extracted from STIBBI Data Mart

HCV case data: Data extracted from STIBBI Data Mart

HCV testing episodes: Data extracted from STIBBI Data Mart

Active Tuberculosis case data: Data extracted from CD Data Mart (source system = Panorama)
